

AutoLoad for Visual Basic™

Thank you for trying out **AutoLoad for Visual Basic™**. I found it a pain in the kahobbies that VB opens up a new project at start up instead of automatically loading the last project. **AutoLoad** solves this, saving you some unnecessary mouse clicks and wasted time. More importantly, it also covers up that ugly, boring VB splash screen with one a lot more exciting.

So let's see... You should have three files:

- | | | |
|--------------------|---|--|
| 1. README.WRI | - | this brilliant, full-featured, complete, and otherwise |
| ROBA | | (read-once, blow-away) help file. |
| 2. CTL3DV2.DLL | - | yet another DLL to toss into your \windows\system |
| directory and | | forget. This enables a 3-D effect for any error message |
| boxes. If | | you want to live in the dark ages of GUI design, you |
| don't need to | | use it. All message boxes will simply have a boring |
| white client area. | | a VB programs so incredibly complex and wonderous it |
| 3. AUTOLOAD.EXE | - | description, or at least I'll spare you one. You can stick |
| defies | | puppy in any directory, although the VB directory is a |
| this little | | logical one. |

There is, alas, a requested \$5.00 donation fee. I'm not really sure what you'll get for it, except peace of mind.

You can send all donations and kudos to:

R. Robar
P.O. Box 254
Franconia, NH 03580
CompuServe: 100030,10

I hope you find the program useful.
