Welcome!

This application demonstrates floating help, floating toolbar and multilingual capabilities.
It may also serve as a start basis for applications conforming to MS application standards.

Some menus have been programmed, others are not. This means, not everything is functional, but may well be used by you by putting code behind it.

The main features of the program (and the source) are the following:

1. **INI handling**: It stores the last window position plus settings

2. **Floating help**: Those little yellow labels plus better explaining text in the status line

3. **Floating toolbar**: You may drag out the toolbar, placing it anywhere you like on screen. You may also place it at the bottom of the window. (Just drag it down and you'll see what happens)

4. **recent file handling**: You may open files recently worked on in the file menu. This is also kept in the ini file, therefore it remains resident after terminating the program.

5. **Multilingual capabilities**: You may switch online between as many languages as you like. In this case you can choose between french, english and german.

This program was written using Visual Basic 3.0 and some API's only!

You can register and thereby receive the complete source for US$11.99 by typing "go swreg" and entering the ID **3082** while logged on CIS.

Normally, it shouldn't take more than two days until delivery via CIS Mail.

Internet users may also register by sending $15.00 by mail to the address below. Please indicate to which address we need to send it (e-mail delivery ONLY).

Have fun!
