## asl.library (basename: _AslBase) V36

```
AllocAslRequest(type,tagList)(d0/a0)
                                - Also stack-based amiga.lib stub
                                  AllocAslRequestTags() alloc an ASL
                                  requester, with TagItem modifiers (V36)
AllocFileRequest()()            - Allocates a FileRequester structure (V36)
AslRequest(request,tagList)(a0/a1)
                                - lso stack-based amiga.lib stub
                                  AslRequestTags(). Get input from user for
                                  an ASL requester (V36)
FreeAslRequest(request)(a0)     - Frees requester obtained from
                                  AllocAslRequest (V36)
FreeFileRequest(fileReq)(a0)    - Frees requester allocated by
                                  AllocFileRequest (V36)
RequestFile(fileReq)(a0)        - request user to select file(s) (V36)
```

## battclock.resource (basename: _BattClockBase)

```
ReadBattClock()()               - Read time from clock chip. (V36)
ResetBattClock()()              - Reset the clock chip. (V36)
WriteBattClock(time)(d0)        - Set the time on the clock chip. (V36)
```

## battmem.resource (basename: _BattMemBase)

```
ObtainBattSemaphore()()         - Obtain access to nonvolatile ram. (V36)
ReadBattMem(buffer,offset,length)(a0,d0/d1)
                                - Read a bitstring from nonvolatile ram.
                                  (V36)
ReleaseBattSemaphore()()        - Allow nonvolatile ram to others. (V36)
WriteBattMem(buffer,offset,length)(a0,d0/d1)
                                - Write a bitstring to nonvolatile ram.
                                  (V36)
```

## clipboard.device (device commands)

```
CBD_CHANGEHOOK                  - Add or remove a clip change hook.
```

## commodities.library (basename: _CxBase) V36

```
ActivateCxObj(co,true)(a0,d0)   - Change the activation state of a commodity
                                  object.
AddIEvents(events)(a0)          - Add input events to commodities' input
                                  stream. (V36)
AttachCxObj(headobj,co)(a0/a1)  - Attach a commodity object to the end of an
                                  existing
ClearCxObjError(co)(a0)         - Clear the accumulated error value of a
                                  commodity
CreateCxObj(type,arg1,arg2)(d0/a0/a1)
                                - Create a new commodity object. (V36)
CxBroker(nb,error)(a0,d0)       - Create a commodity broker. (V36)
CxMsgData(cxm)(a0)              - Obtain a pointer to a commodity message's
                                  data area. (V36)
CxMsgID(cxm)(a0)                - Obtain the ID of a commodity message.
                                  (V36)
CxMsgType(cxm)(a0)              - Obtain the type of a commodity message.
                                  (V36)
CxObjError(co)(a0)              - Obtain a commodity object's accumulated
                                  error. (V36)
CxObjType(co)(a0)               - Obtain the type of a commodity object.
                                  (V36)
DeleteCxObj(co)(a0)             - Delete a commmodity object. (V36)
DeleteCxObjAll(co)(a0)          - Recursively delete a tree of commodity
                                  objects.
DisposeCxMsg(cxm)(a0)           - Delete a commodity message. (V36)
DivertCxMsg(cxm,headobj,ret)(a0/a1/a2)
                                - Send a commodity message down an object
                                  list. (V36)
EnqueueCxObj(headobj,co)(a0/a1) - Insert a commodity object within a list
                                  of objects
InsertCxObj(headobj,co,pred)(a0/a1/a2)
                                - Insert a commodity object in a list after
                                  a given
InvertKeyMap(ansicode,event,km)(d0/a0/a1)
                                - Generate an input event from an ANSI
                                  code. (V36)
ParseIX(description,ix)(a0/a1)  - Initialize an input expression given a
                                  description string.
RemoveCxObj(co)(a0)             - Remove a commodity object from a list.
                                  (V36)
RouteCxMsg(cxm,co)(a0/a1)       - Set the next destination of a commodity
                                  message. (V36)
SetCxObjPri(co,pri)(a0,d0)      - Set the priority of a commodity object.
                                  (V36)
SetFilter(filter,text)(a0/a1)   - Change the matching condition of a
                                  commodity filter.
SetFilterIX(filter,ix)(a0/a1)   - Change the matching condition of a
                                  commodity filter.
SetTranslate(translator,events)(a0/a1)
                                - Replace a translator object's translation
                                  list. (V36)
```

## disk.resource (basename: _DiskBase)

```
ReadUnitID(unitNum)(d0)         - Reread and return the type of drive (V37)
```

## diskfont.library (basename: _DiskfontBase)

```
NewScaledDiskFont(sourceFont,destTextAttr)(a0/a1)
                                - Create a DiskFont scaled from another.
                                  (V36)
```

## dos.library (basename: _DOSBase)

```
AbortPkt(port,pkt)(d1/d2)       - Aborts an asynchronous packet, if
                                  possible. (V36)
AddBuffers(name,number)(d1/d2)  - Changes the number of buffers for a
                                  filesystem (V36)
AddDosEntry(dlist)(d1)          - Add a Dos List entry to the lists (V36)
AddPart(dirname,filename,size)(d1/d2/d3)
                                - Appends a file/dir to the end of a path
                                  (V36)
AddSegment(name,seg,system)(d1/d2/d3)
                                - Adds a resident segment to the resident
                                  list (V36)
AllocDosObject(type,tags)(d1/d2) - Creates a dos object (V36)
AssignAdd(name,lock)(d1/d2)     - Adds a lock to an assign for multi-
                                  directory assigns (V36)
AssignLate(name,path)(d1/d2)    - Creates an assignment to a specified path
                                  later (V36)
AssignLock(name,lock)(d1/d2)    - Creates an assignment to a locked object
                                  (V36)
```

```
AssignPath(name,path)(d1/d2)      - Creates an assignment to a specified path
                                    (V36)
AttemptLockDosList(flags)(d1)     - Attempt to lock the Dos Lists for use
                                    (V36)
ChangeMode(type,fh,newmode)(d1/d2/d3)- Change the current mode of a lock or
                                    filehandle (V36)
CheckSignal(mask)(d1)             - Checks for break signals (V36)
Cli()()                           - Returns a pointer to the CLI structure of
                                    the process (V36)
CliInitNewcli(dp)(a0)             - Set up a process as a shell according to
                                    the inital packet.
CliInitRun(dp)(a0)                - Set up a process as a shell according to
                                    the inital packet.
CompareDates(date1,date2)(d1/d2)  - Compares two datestamps (V36)
CreateNewProc(tags)(d1)           - Create a new process (V36)
DateToStr(datetime)(d1)           - Converts a DateStamp to a string (V36)
DeleteVar(name,flags)(d1/d2)      - Deletes a local or environment variable
                                    (V36)
DoPkt(port,action,arg1,arg2,arg3,arg4,arg5)(d1/d2/d3/d4/d5/d6/d7)
                                  - Send a dos packet and wait for reply (V36)
DupLockFromFH(fh)(d1)             - Gets a lock on an open file (V36)
EndNotify(notify)(d1)             - Ends a notification request (V36)
ErrorReport(code,type,arg1,device)(d1/d2/d3/d4)
                                  - Displays a Retry/Cancel requester for an
                                    error (V36)
ExAll(lock,buffer,size,data,control)(d1/d2/d3/d4/d5)
                                  - Examine an entire directory (V36)
ExamineFH(fh,fib)(d1/d2)          - Gets information on an open file (V36)
Fault(code,header,buffer,len)(d1/d2/d3/d4)
                                  - Returns the text associated with a DOS
                                    error code (V36)
FGetC(fh)(d1)                     - Read a character from the specified input
                                    (buffered) (V36)
FGets(fh,buf,buflen)(d1/d2/d3)    - Reads a line from the specified input
                                    (buffered) (V36)
FilePart(path)(d1)                - Returns the last component of a path (V36)
FindArg(keyword,template)(d1/d2)  - Find a keyword in a template (V36)
FindCliProc(num)(d1)              - Returns a pointer to the requested CLI
                                    process (V36)
FindDosEntry(dlist,name,flags)(d1/d2/d3)
                                  - Finds a specific Dos List entry (V36)
FindSegment(name,seg,system)(d1/d2/d3)
                                  - Finds a segment on the resident list (V36)
FindVar(name,type)(d1/d2)         - Finds a local variable (V36)
Flush(fh)(d1)                     - Flushes buffers for a buffered filehandle
                                    (V36)
Format(filesystem,volumename,dostype)(d1/d2/d3)
                                  - Causes a filesystem to initialize itself
                                    (V36)
FPutC(fh,ch)(d1/d2)               - Write a character to the specified output
                                    (buffered) (V36)
FPuts(fh,str)(d1/d2)              - Writes a string the the specified output
                                    (buffered) (V36)
FRead(fh,block,blocklen,number)(d1/d2/d3/d4)
                                  - Reads a number of blocks from an input
                                    (buffered) (V36)
FreeArgs(args)(d1)                - Free allocated memory after ReadArgs()
                                    (V36)

FreeDeviceProc(dp)(d1)            - Releases port returned by GetDeviceProc()
                                    (V36)
FreeDosEntry(dlist)(d1)           - Frees an entry created by MakeDosEntry
                                    (V36)
FreeDosObject(type,ptr)(d1/d2)    - Frees an object allocated by
                                    AllocDosObject() (V36)
FWrite(fh,block,blocklen,number)(d1/d2/d3/d4)
                                  - Writes a number of blocks to an output
                                    (buffered) (V36)
```

```
GetArgStr()()                     - Returns the arguments for the process
                                    (V36)
GetConsoleTask()()                - Returns the default console for the
                                    process (V36)
GetCurrentDirName(buf,len)(d1/d2) - Returns the current directory name (V36)
GetDeviceProc(name,dp)(d1/d2)     - Finds a handler to send a message to (V36)
GetFileSysTask()()                - Returns the default filesystem for the
                                    process (V36)
GetProgramDir()()                 - Returns a lock on the directory the
                                    program was loaded
GetProgramName(buf,len)(d1/d2)    - Returns the current program name (V36)
GetPrompt(buf,len)(d1/d2)         - Returns the prompt for the current process
                                    (V36)
GetVar(name,buffer,size,flags)(d1/d2/d3/d4)
                                  - Returns the value of a local or global
                                    variable (V36)
Inhibit(name,onoff)(d1/d2)        - Inhibits access to a filesystem (V36)
InternalLoadSeg(fh,table,funcarray,stack)(d0/a0/a1/a2)
                                  - Low-level load routine (V36)
InternalUnLoadSeg(seglist,freefunc)(d1/a1)
                                  - Unloads a seglist loaded with
                                    InternalLoadSeg() (V36)
IsFileSystem(name)(d1)            - Returns whether a Dos handler is a
                                    filesystem (V36)
LockDosList(flags)(d1)            - Locks the specified Dos Lists for use
                                    (V36)
LockRecord(fh,offset,length,mode,timeout)(d1/d2/d3/d4/d5)
                                  - Locks a portion of a file (V36)
LockRecords(recArray,timeout)(d1/d2)
                                  - Lock a series of records (V36)
MakeDosEntry(name,type)(d1/d2)    - Creates a DosList structure (V36)
MakeLink(name,dest,soft)(d1/d2/d3)
                                  - Creates a filesystem link (V36)
MatchEnd(anchor)(d1)              - Free storage allocated for
                                    MatchFirst()/MatchNext() (V36)
MatchFirst(pat,anchor)(d1/d2)     - Finds file that matches pattern (V36)
MatchNext(anchor)(d1)             - Finds the next file or directory that
                                    matches pattern (V36)
MatchPattern(pat,str)(d1/d2)      - Checks for a pattern match with a string
                                    (V36)
MatchPatternNoCase(pat,str)(d1/d2)
                                  - Checks for a pattern match with a string
                                    (V37)
MaxCli()()                        - Returns the highest CLI process number
                                    possibly in use (V36)
NameFromFH(fh,buffer,len)(d1/d2/d3)
                                  - Get the name of an open filehandle (V36)
NameFromLock(lock,buffer,len)(d1/d2/d3)
                                  - Returns the name of a locked object (V36)
NewLoadSeg(file,tags)(d1/d2)      - Improved version of LoadSeg for stacksizes
                                    (V36)
NextDosEntry(dlist,flags)(d1/d2)  - Get the next Dos List entry (V36)
OpenFromLock(lock)(d1)            - Opens a file you have a lock on (V36)
ParentOfFH(fh)(d1)                - Returns a lock on the parent directory of
                                    a file (V36)
ParsePattern(pat,buf,buflen)(d1/d2/d3)
                                  - Create a tokenized string for
                                    MatchPattern() (V36)
ParsePatternNoCase(pat,buf,buflen)(d1/d2/d3)
                                  - Create a tokenized string for
PathPart(path)(d1)                - Returns a pointer to the end of the next-
                                    to-last (V36)
PrintFault(code,header)(d1/d2)    - Returns the text associated with a DOS
                                    error code (V36)
PutStr(str)(d1)                   - Writes a string the the default output
                                    (buffered) (V36)
ReadArgs(template,array,args)(d1/d2/d3)
                                  - Parse the command line input (V36)
```

```
ReadItem(name,maxchars,cSource)(d1/d2/d3)
                              - Reads a single argument/name from command
                                line (V36)
ReadLink(port,lock,path,buffer,size)(d1/d2/d3/d4/d5)
                              - Reads the path for a soft filesystem link
                                (V36)
Relabel(drive,newname)(d1/d2)     - Change the volume name of a volume (V36)
RemAssignList(name,lock)(d1/d2)   - Remove an entry from a multi-dir assign
                                (V36)
RemDosEntry(dlist)(d1)            - Removes a Dos List entry from it's list
                                (V36)
RemSegment(seg)(d1)               - Removes a resident segment from the
                                resident list (V36)
ReplyPkt(dp,res1,res2)(d1/d2/d3)  - Replies a packet to the person who sent it
                                to you (V36)
RunCommand(seg,stack,paramptr,paramlen)(d1/d2/d3/d4)
                              - Runs a program using the current process
                                (V36)
SameDevice(lock1,lock2)(d1/d2)    - Are two locks are on partitions of the
                                device? (V37)
SameLock(lock1,lock2)(d1/d2)      - Returns whether two locks are on the same
                                object (V36)
SelectInput(fh)(d1)               - Select a filehandle as the default input
                                channel (V36)
SelectOutput(fh)(d1)              - Select a filehandle as the default input
                                channel (V36)
SendPkt(dp,port,replyport)(d1/d2/d3)
                              - Sends a packet to a handler (V36)
SetArgStr(string)(d1)             - Sets the arguments for the current process
                                (V36)
SetConsoleTask(task)(d1)          - Sets the default console for the process
                                (V36)
SetCurrentDirName(name)(d1)       - Sets the directory name for the process
                                (V36)
SetFileDate(name,date)(d1/d2)     - Sets the modification date for a file or
                                dir (V36)
SetFileSize(fh,pos,mode)(d1/d2/d3)
                              - Sets the size of a file (V36)
SetFileSysTask(task)(d1)          - Sets the default filesystem for the
                                process (V36)
SetIoErr(result)(d1)              - Sets the value returned by IoErr() (V36)
SetMode(fh,mode)(d1/d2)           - Set the current behavior of a handler
                                (V36)
SetProgramDir(lock)(d1)           - Sets the directory returned by
                                GetProgramDir (V36)
SetProgramName(name)(d1)          - Sets the name of the program being run
                                (V36)
SetPrompt(name)(d1)               - Sets the CLI/shell prompt for the current
                                process (V36)
SetVar(name,buffer,size,flags)(d1/d2/d3/d4)
                              - Sets a local or environment variable (V36)
SetVBuf(fh,buff,type,size)(d1/d2/d3/d4)
                              - Set buffering modes and size (V36)
SplitName(name,seperator,buf,oldpos,size)(d1/d2/d3/d4/d5)
                              - Splits out a component of a pathname into
                                a buffer (V36)
StartNotify(notify)(d1)           - Starts notification on a file or directory
                                (V36)
StrToDate(datetime)(d1)           - Converts a string to a DateStamp (V36)
StrToLong(string,value)(d1/d2)    - String to long value (decimal) (V36)
SystemTagList(command,tags)(d1/d2)
                              - Have a shell execute a command line (V36)
UnGetC(fh,character)(d1/d2)       - Makes a char available for reading again.
                                (buffered) (V36)
UnLockDosList(flags)(d1)          - Unlocks the Dos List (V36)
UnLockRecord(fh,offset,length)(d1/d2/d3)
                              - Unlock a record (V36)
UnLockRecords(recArray)(d1)       - Unlock a list of records (V36)
```

```
VFPrintf(fh,format,argarray)(d1/d2/d3)
                                  - Format and print a string to a file
                                    (buffered) (V36)
VFWritef(fh,format,argarray)(d1/d2/d3)
                                  - Write a BCPL formatted string to a file
                                    (buffered) (V36)
VPrintf(format,argarray)(d1/d2)   - Format and print string (buffered) (V36)
WaitPkt()()                       - Waits for a packet to arrive at your
                                    pr_MsgPort (V36)
WriteChars(buf,buflen)(d1/d2)     - Writes bytes to the the default output
                                    (buffered) (V36)
```

## exec.library (basename: _SysBase)

```
AllocVec(byteSize,requirements)(d0/d1)
                                  - Allocate memory and keep track of the
                                    size  (V36)
CacheClearE(address,length,caches)(a0,d0/d1)
                                  - Cache clearing with extended control
                                    (V37)
CacheClearU()()                   - User callable simple cache clearing (V37)
CacheControl(cacheBits,cacheMask)(d0/d1)
                                  - Instruction & data cache control
CachePostDMA(address,length,flags)(a0/a1,d1)
                                  - Take actions after to hardware DMA  (V37)
CachePreDMA(address,length,flags)(a0/a1,d1)
                                  - Take actions prior to hardware DMA  (V37)
ColdReboot()()                    - Reboot the Amiga (V36)
CreateIORequest(port,size)(a0,d0) - Create an IORequest structure  (V36)
CreateMsgPort()()                 - Allocate and initialize a new message
                                    port  (V36)
DeleteIORequest(iorequest)(a0)    - Free a request made by CreateIORequest()
                                    (V36)
DeleteMsgPort(port)(a0)           - Free a message port created by
                                    CreateMsgPort  (V36)
FreeVec(memoryBlock)(a1)          - Return AllocVec() memory to the system
                                    (V36)
ObtainSemaphoreShared(sigSem)(a0) - Gain shared access to a semaphore (V36)
StackSwap(newSize,newSP,newStack)(d0/d1/a0)
                                  - Exec supported method of replacing a
                                    task's stack.
```

## expansion.library (basename: _ExpansionBase)

```
AddBootNode(bootPri,flags,deviceNode,configDev)(d0/d1/a0/a1)
                                  - Add a BOOTNODE to the system (V36)
```

## gadtools.library (basename: _GadToolsBase)  V36

```
CreateContext(glistptr)(a0)       - Create a place for GadTools context data.
                                    (V36)
CreateGadgetA(kind,gad,ng,taglist)(d0/a0/a1/a2)
                                  - Allocate and initialize a gadtools
                                    gadget. (V36)
CreateMenusA(newmenu,taglist)(a0/a1)
                                  - Allocate and fill out a menu structure.
                                    (V36)
DrawBevelBoxA(rport,left,top,width,height,taglist)(a0,d0/d1/d2/d3/a1)
                                  - Draws a bevelled box. (V36)
FreeGadgets(gad)(a0)              - Free a linked list of gadgets. (V36)
FreeMenus(menu)(a0)               - Frees memory allocated by CreateMenusA().
                                    (V36)
```

```
FreeVisualInfo(vi)(a0)            - Return any resources taken by
                                    GetVisualInfo. (V36)
GetVisualInfoA(screen,taglist)(a0/a1)
                                  - Get information GadTools needs for
                                    visuals. (V36)
GT_BeginRefresh(win)(a0)          - Begin refreshing friendly to GadTools.
                                    (V36)
GT_EndRefresh(win,complete)(a0,d0)
                                  - End refreshing friendly to GadTools.
                                    (V36)
GT_FilterIMsg(imsg)(a1)           - Filter an IntuiMessage through GadTools.
                                    (V36)
GT_GetIMsg(iport)(a0)             - Get an IntuiMessage, with GadTools
                                    processing. (V36)
GT_PostFilterIMsg(imsg)(a1)       - Return the unfiltered message after
GT_RefreshWindow(win,req)(a0/a1)  - Refresh all the GadTools gadgets. (V36)
GT_ReplyIMsg(imsg)(a1)            - Reply a message obtained with
                                    GT_GetIMsg(). (V36)
GT_SetGadgetAttrsA(gad,win,req,taglist)(a0/a1/a2/a3)
                                  - Change the attributes of a GadTools
                                    gadget. (V36)
LayoutMenuItemsA(firstitem,vi,taglist)(a0/a1/a2)
                                  - Position all the menu items. (V36)
LayoutMenusA(firstmenu,vi,taglist)(a0/a1/a2)
                                  - Position all the menus and menu items.
                                    (V36)
```

## graphics.library (basename: _GfxBase)

```
BitMapScale(bitScaleArgs)(a0)     - Perform raster scaling on a bit map.
                                    (V36)
CloseMonitor(monitorSpec)(a0)     - Close a MonitorSpec (V36)
EraseRect(rp,xMin,yMin,xMax,yMax)(a1,d0/d1/d2/d3)
                                  - Fill a defined rectangular area using the
                                    current BackFill hook. (V36)
ExtendFont(font,fontTags)(a0/a1)  - Ensure tf_Extension has been built for a
                                    font (V36)
FindDisplayInfo(displayID)(d0)    - Search for a record identified by a
                                    specific key (V36)
FontExtent(font,fontExtent)(a0/a1)
                                  - Get the font attributes of the current
                                    font (V36)
GetDisplayInfoData(handle,buf,size,tagID,displayID)(a0/a1,d0/d1/d2)
                                  - Query DisplayInfo Record parameters (V36)
GetVPModeID(vp)(a0)               - Get the 32 bit DisplayID from a ViewPort.
                                    (V36)
GfxAssociate(associateNode,gfxNodePtr)(a0/a1)
                                  - Associate a graphics extended node with a
                                    given pointer
GfxFree(gfxNodePtr)(a0)           - Free a graphics extended data structure
                                    (V36)
GfxLookUp(associateNode)(a0)      - Find a graphics extended node associated
                                    with a given pointer (V36)
GfxNew(gfxNodeType)(d0)           - Allocate a graphics extended data
                                    structure (V36)
ModeNotAvailable(modeID)(d0)      - Check to see if a DisplayID isn't
                                    available. (V36)
NextDisplayInfo(displayID)(d0)    - Iterate current displayinfo identifiers
                                    (V36)
OpenMonitor(monitorName,displayID)(a1,d0)
                                  - Open a named MonitorSpec (V36)
ReadPixelArray8(rp,xstart,ystart,xstop,ystop,array,temprp)(a0,d0/d1/d2/d3/a2,
                                    a1)
                                  - Read the pen number value of a
                                    rectangular array
ReadPixelLine8(rp,xstart,ystart,width,array,tempRP)(a0,d0/d1/d2/a2,a1)
                                  - Read the pen number value of a horizontal
                                    line
ScalerDiv(factor,numerator,denominator)(d0/d1/d2)
                                  - Get the scaling result that BitMapScale
                                    would. (V36)
StripFont(font)(a0)               - Remove the tf_Extension from a font (V36)
TextExtent(rp,string,count,textExtent)(a1,a0,d0/a2)
                                  - Determine raster extent of text data.
                                    (V36)
TextFit(rp,string,strLen,textExtent,constrainingExtent, strDirection,
 constrainingBitWidth, constrainingBitHeight)(a1,a0,d0/a2/a3,d1/d2/d3)
                                  - Count characters that will fit in a given
                                    extent (V36)
VideoControl(colorMap,tagarray)(a0/a1)
                                  - Modify the operation of a ViewPort's
                                    ColorMap (V36)
WeighTAMatch(reqTextAttr,targetTextAttr,targetTags)(a0/a1/a2)
                                  - Get a measure of how well two fonts match.
                                    (V36)
WritePixelArray8(rp,xstart,ystart,xstop,ystop,array,
temprp)(a0,d0/d1/d2/d3/a2,a1)     - Write the pen number value of a
                                    rectangular array
WritePixelLine8(rp,xstart,ystart,width,array,tempRP)(a0,d0/d1/d2/a2,a1)
                                  - Write the pen number value of a horizontal
                                    line
```

## icon.library (basename: _IconBase)

```
DeleteDiskObject(name)(a0)        - Delete a Workbench disk object from disk.
GetDefDiskObject(type)(d0)        - Read default wb disk object from disk.
                                    (V36)
GetDiskObjectNew(name)(a0)        - Read in a Workbench disk object from disk.
PutDefDiskObject(diskObject)(a0)  - Write disk object as the default for its
                                    type.  (V36)
```

## iffparse.library (basename: _IFFParseBase)  V36

```
AllocIFF()()                      - Create a new IFFHandle structure.
AllocLocalItem(type,id,ident,dataSize)(d0/d1/d2/d3)
                                  - Create a local context item structure.
CloseClipboard(clipboard)(a0)     - Close and free an open ClipboardHandle.
CloseIFF(iff)(a0)                 - Close an IFF context.
CollectionChunk(iff,type,id)(a0,d0/d1)
                                  - Declare a chunk type for collection.
CollectionChunks(iff,propArray,nProps)(a0/a1,d0)
                                  - Declare many collection chunks at once.
CurrentChunk(iff)(a0)             - Get context node for current chunk.
EntryHandler(iff,type,id,position,handler,object)(a0,d0/d1/d2/a1/a2)
                                  - Add an entry handler to the IFFHandle
                                    context.
ExitHandler(iff,type,id,position,handler,object)(a0,d0/d1/d2/a1/a2)
                                  - Add an exit handler to the IFFHandle
                                    context.
FindCollection(iff,type,id)(a0,d0/d1)
                                  - Get a pointer to the current list of
                                    collection
FindLocalItem(iff,type,id,ident)(a0,d0/d1/d2)
                                  - Return a local context item from the
                                    context stack.
FindProp(iff,type,id)(a0,d0/d1)   - Search for a stored property chunk.
FindPropContext(iff)(a0)          - Get the property context for the current
                                    state.
```

```
FreeIFF(iff)(a0)                - Deallocate an IFFHandle struct.
FreeLocalItem(localItem)(a0)    - Deallocate a local context item structure.
GoodID(id)(d0)                  - Test if an identifier follows the IFF 85
                                  specification.
GoodType(type)(d0)              - Test if a type follows the IFF 85
                                  specification.
IDtoStr(id,buf)(d0/a0)          - Convert a longword identifier to a null-
                                  terminated string.
InitIFF(iff,flags,streamHook)(a0,d0/a1)
                                - Initialize an IFFHandle struct as a user
                                  stream.
InitIFFasClip(iff)(a0)          - Initialize an IFFHandle as a clipboard
                                  stream.
InitIFFasDOS(iff)(a0)           - Initialize an IFFHandle as a DOS stream.
LocalItemData(localItem)(a0)    - Get pointer to user data for local context
                                  item.
OpenClipboard(unitNum)(d0)      - Create a handle on a clipboard unit.
OpenIFF(iff,rwMode)(a0,d0)      - Prepare an IFFHandle to read or write a
                                  new IFF stream.
ParentChunk(contextNode)(a0)    - Get the nesting context node for the given
                                  chunk.
ParseIFF(iff,control)(a0,d0)    - Parse an IFF file from an IFFHandle struct
                                  stream.
PopChunk(iff)(a0)               - Pop top context node off context stack.
PropChunk(iff,type,id)(a0,d0/d1) - Specify a property chunk to store.
PropChunks(iff,propArray,nProps)(a0/a1,d0)
                                - Declare many property chunks at once.
PushChunk(iff,type,id,size)(a0,d0/d1/d2)
                                - Push a new context node on the context
                                  stack.
ReadChunkBytes(iff,buf,size)(a0/a1,d0)
                                - Read bytes from the current chunk into a
                                  buffer.
ReadChunkRecords(iff,buf,bytesPerRecord,nRecords)(a0/a1,d0/d1)
                                - Read record elements from the current
                                  chunk into
SetLocalItemPurge(localItem,purgeHook)(a0/a1)
                                - Set purge vector for a local context item.
StopChunk(iff,type,id)(a0,d0/d1) - Declare a chunk which should cause
                                  ParseIFF to return.
StopChunks(iff,propArray,nProps)(a0/a1,d0)
                                - Declare many stop chunks at once.
StopOnExit(iff,type,id)(a0,d0/d1)
                                - Declare a stop condition for exiting a
                                  chunk.
StoreItemInContext(iff,localItem,contextNode)(a0/a1/a2)
                                - Store local context item in given context
                                  node.
StoreLocalItem(iff,localItem,position)(a0/a1,d0)
                                - Insert a local context item into the
                                  context stack.
WriteChunkBytes(iff,buf,size)(a0/a1,d0)
                                - Write data from a buffer into the current
                                  chunk.
WriteChunkRecords(iff,buf,bytesPerRecord,nRecords)(a0/a1,d0/d1)
                                - Write records from a buffer to the current
```

## input.device (basename: _InputBase)

```
PeekQualifier()()               - Get the input device's current qualifiers
                                  (V36)
```

## intuition.library (basename: _IntuitionBase)

```
AddClass(class)(a0)             - Make a public class available (V36)
BuildEasyRequestArgs(window,easyStruct,idcmp,args)(a0/a1,d0/a3)
                                - Simple creation of system request. (V36)
ChangeWindowBox(window,left,top,width,height)(a0,d0/d1/d2/d3)
                                - Change window position and dimensions.
                                  (V36)
DisposeObject(object)(a0)       - Deletes a 'boopsi' object. (V36)
DrawImageState(rp,image,leftOffset,topOffset,state,
drawInfo)(a0/a1,d0/d1/d2/a2)    - Draw an (extended) Intuition Image with
EasyRequestArgs(window,easyStruct,idcmpPtr,args)(a0/a1/a2/a3)
                                - Easy alternative to AutoRequest(). (V36)
EraseImage(rp,image,leftOffset,topOffset)(a0/a1,d0/d1)
                                - Erases an Image. (V36)
FreeClass(classPtr)(a0)         - Frees a boopsi class created by
                                  MakeClass(). (V36)
FreeScreenDrawInfo(screen,drawInfo)(a0/a1)
                                - Finish using a DrawInfo structure. (V36)

GadgetMouse(gadget,gInfo,mousePoint)(a0/a1/a2)
                                - Calculate gadget-relative mouse position.
                                  (V36)
GetAttr(attrID,object,storagePtr)(d0/a0/a1)
                                - Inquire the value of some attribute of an
                                  object. (V36)
GetDefaultPubScreen(nameBuffer)(a0)
                                - Get name of default public screen. (V36)
GetScreenDrawInfo(screen)(a0)   - Get pointer to rendering information.
                                  (V36)
LockPubScreen(name)(a0)         - Prevent a public screen from closing.
                                  (V36)
LockPubScreenList()()           - Prevent changes to the system list. (V36)
MakeClass(classID,superClassID,superClassPtr,instanceSize,flags)(a0/a1/a2,d0/
                                  d1)
                                - Create and initialize a boopsi class.
                                  (V36)
MoveWindowInFrontOf(window,behindWindow)(a0/a1)
                                - Arrange the relative depth of a window.
                                  (V36)
NewObjectA(class,classID,tagList)(a0/a1/a2)
                                - Create an object from a class. (V36)
NextObject(objectPtrPtr)(a0)    - Iterate through the object on an Exec
                                  list. (V36)
NextPubScreen(screen,namebuf)(a0/a1)
                                - Identify next public screen in the cycle.
                                  (V36)
ObtainGIRPort(gInfo)(a0)        - Set up a RastPort for a custom gadget.
                                  (V36)
OpenScreenTagList(newScreen,tagList)(a0/a1)
                                - Also stack-based amiga.lib stub
                                  OpenScreenTags().  OpenScreen() with
                                  TagItem extension array. (V36)
OpenWindowTagList(newWindow,tagList)(a0/a1)
                                - Also stack-based amiga.lib stub
                                  OpenWindowTags().  OpenWindow() with
                                  TagItem extension. (V36)
PointInImage(point,image)(d0/a0) - Tests whether an image "contains" a point.
                                  (V36)
PubScreenStatus(screen,statusFlags)(a0,d0)
                                - Change status flags for a public screen.
                                  (V36)
QueryOverscan(displayID,rect,oScanType)(a0/a1,d0)
                                - Inquire about a standard overscan region.
                                  (V36)
ReleaseGIRPort(rp)(a0)          - Release a custom gadget RastPort. (V36)
RemoveClass(classPtr)(a0)       - Make a public boopsi class unavailable.
                                  (V36)
```

```
ResetMenuStrip(window,menu)(a0/a1)
                                - Re-attach a menu strip to a window. (V36)
SetAttrsA(object,tagList)(a0/a1)  - Specify attribute values for an object.
                                  (V36)
SetDefaultPubScreen(name)(a0)     - Choose a new default public screen. (V36)
SetEditHook(hook)(a0)             - Set global processing for string gadgets.
                                  (V36)
SetGadgetAttrsA(gadget,window,requester,tagList)(a0/a1/a2/a3)
                                - Specify attribute values for a boopsi
                                  gadget. (V36)
SetMouseQueue(window,queueLength)(a0,d0)
                                - Change limit on pending mouse messages.
                                  (V36)
SetPubScreenModes(modes)(d0)      - Establish global public screen behavior.
                                  (V36)
SysReqHandler(window,idcmpPtr,waitInput)(a0/a1,d0)
                                - Handle system requester input. (V36)
UnlockPubScreen(name,screen)(a0/a1)
                                - Release lock on a public screen. (V36)
UnlockPubScreenList()()           - Release public screen list semaphore.
                                  (V36)
ZipWindow(window)(a0)             - Change window to "alternate" position and
```

## keymap.library (basename: _KeymapBase)

```
AskKeyMapDefault()()              - Ask for a pointer to the current default
MapANSI(string,count,buffer,length,keyMap)(a0,d0/a1,d1/a2)
                                - Encode an ANSI string into keycodes.
                                  (V36)
MapRawKey(event,buffer,length,keyMap)(a0/a1,d1/a2)
                                - Decode single raw key input event to an
                                  ANSI
SetKeyMapDefault(keyMap)(a0)      - Set the current default keymap. (V36)
```

## layers.library (basename: _LayersBase)

```
CreateBehindHookLayer(li,bm,x0,y0,x1,y1,flags,hook,
bm2)(a0/a1,d0/d1/d2/d3/d4/a3,a2)  - Create a new layer behind all existing
                                  layers,
CreateUpfrontHookLayer(li,bm,x0,y0,x1,y1,flags,hook,
bm2)(a0/a1,d0/d1/d2/d3/d4/a3,a2)  - Create a new layer on top of existing
                                  layers,
InstallLayerHook(layer,hook)(a0/a1)
                                - Safely install a new Layer->BackFill
                                  hook.
MoveSizeLayer(layer,dx,dy,dw,dh)(a0,d0/d1/d2/d3)
                                - Position/Size layer
```

## mathieeesingbas.library (basename: _MathIeeeSingBasBase) V36

```
IEEESPAbs(parm)(d0)               - Compute absolute value of IEEE single
                                  precision argument
IEEESPAdd(leftParm,rightParm)(d0/d1)
                                - Add one single precision IEEE number to
                                  another
IEEESPCeil(parm)(d0)              - Compute Ceil function of IEEE single
                                  precision number
IEEESPCmp(leftParm,rightParm)(d0/d1)
                                - Compare two single precision floating
                                  point numbers
IEEESPDiv(dividend,divisor)(d0/d1)- Divide one single precision IEEE by
                                  another
IEEESPFix(parm)(d0)               - Convert IEEE single float to integer
IEEESPFloor(parm)(d0)             - Compute Floor function of IEEE single
                                  precision number
IEEESPFlt(integer)(d0)            - Convert integer to IEEE single precision
                                  number
IEEESPMul(leftParm,rightParm)(d0/d1)
                                - Multiply one double precision IEEE number
                                  by another
IEEESPNeg(parm)(d0)               - Compute negative value of IEEE single
                                  precision number
IEEESPSub(leftParm,rightParm)(d0/d1)
                                - Subtract one single precision IEEE number
                                  from another
IEEESPTst(parm)(d0)               - Compare IEEE single precision value to
                                  0.0
```

## mathieeesingtrans.library (basename: _MathIeeeSingTransBase) V36

```
IEEESPAcos(parm)(d0)              - Compute the arc cosine of a number
IEEESPAsin(parm)(d0)              - Compute the arcsine of a number
IEEESPAtan(parm)(d0)              - Compute the arc tangent of number
IEEESPCos(parm)(d0)               - Compute the cosine of a floating point
                                  number
IEEESPCosh(parm)(d0)              - Compute the hyperbolic cosine of a
                                  floating point number
IEEESPExp(parm)(d0)               - Compute the exponential of e
IEEESPFieee(parm)(d0)             - Convert IEEE single to IEEE single
IEEESPLog(parm)(d0)               - Compute the natural logarithm of a
                                  floating point number
IEEESPLog10(parm)(d0)             - Compute logarithm base 10 of a number
IEEESPPow(exp,arg)(d1,d0)         - Raise a number to another number power
IEEESPSin(parm)(d0)               - Compute the sine of a floating point
                                  number
IEEESPSincos(cosptr,parm)(a0,d0)  - Compute the arc tangent of a floating
                                  point number
IEEESPSinh(parm)(d0)              - Compute the hyperbolic sine of a floating
                                  point number
IEEESPSqrt(parm)(d0)              - Compute the square root of a number
IEEESPTan(parm)(d0)               - Compute the tangent of a floating point
                                  number
IEEESPTanh(parm)(d0)              - Compute the hyperbolic tangent of a
                                  floating point number
IEEESPTieee(parm)(d0)             - Convert IEEE single to IEEE single
```

## ramdrive.device (basename: _RamdriveDevice)

```
KillRAD(unit)(d0)                 - Kill ramdrive.device unit
KillRAD0()()                      - Kill ramdrive.device unit 0
```

## rexxsyslib.library (basename: _RexxSysBase) V36

```
ClearRexxMsg(msgptr,count)(a0,d0) - Releases and clears the argument array in
                                  a RexxMsg
CreateArgstring(string,length)(a0,d0)
                                - Create an argument string structure
CreateRexxMsg(port,extension,host)(a0/a1,d0)
                                - Create an ARexx message structure
DeleteArgstring(argstring)(a0)    - Releases an Argstring created by
                                  CreateArgstring()
DeleteRexxMsg(packet)(a0)         - Releases a RexxMsg structure created by
                                  CreateRexxMsg()
```

```
FillRexxMsg(msgptr,count,mask)(a0,d0/d1)
                                - Fill the argument strings as needed
IsRexxMsg(msgptr)(a0)           - Function to determine if a message came
                                  from ARexx
LengthArgstring(argstring)(a0)  - Returns the length value stored in the
                                  argstring
LockRexxBase(resource)(d0)      - Obtain a semaphore lock on the RexxBase
                                  structure
UnlockRexxBase(resource)(d0)    - Release a semaphore lock on the RexxBase
                                  structure
```

## Timer.Device (basename: _TimerBase)

```
GetSysTime(dest)(a0)            - Get the system time. (V36)
ReadEClock(dest)(a0)            - Get the current value of the E-Clock.
                                  (V36)
```

## trackdisk.device (device commands)

```
TD_GETGEOMETRY                  - Gets the disk geometry table.
TD_EJECT                        - For those drives that support it.
```

## utility.library (basename: _UtilityBase)  V36

```
AllocateTagItems(numItems)(d0)  - Allocate a TagItem array (or chain).
                                  (V36)
Amiga2Date(amigaTime,date)(d0/a0) - Calculate the date from a timestamp.
                                  (V36)
CallHookPkt(hook,object,paramPacket)(a0/a2,a1)
                                - Invoke a Hook function callback. (V36)
CheckDate(date)(a0)             - Checks ClockData struct for legal date.
                                  (V36)
CloneTagItems(tagList)(a0)      - Copies a TagItem list.  (V36)
Date2Amiga(date)(a0)            - Calculate seconds from 01-Jan-1978.
                                  (V36)
FilterTagChanges(newTagList,oldTagList,apply)(a0/a1,d0)
                                - Eliminate TagItems which specify no
                                  change. (V36)
FilterTagItems(tagList,filterArray,logic)(a0/a1,d0)
                                - Remove selected items from a TagItem
                                  list. (V36)
FindTagItem(tagVal,tagList)(d0/a0)
                                - Scans TagItem list for a Tag. (V36)
FreeTagItems(tagList)(a0)       - Frees allocated TagItem lists. (V36)
GetTagData(tagVal,defaultVal,tagList)(d0/d1/a0)
                                - Obtain data corresponding to Tag. (V36)
MapTags(tagList,mapList,includeMiss)(a0/a1,d0)
                                - Convert ti_Tag values in a list via map
                                  pairing. (V36)
NextTagItem(tagListPtr)(a0)     - Iterate TagItem lists. (V36)
PackBoolTags(initialFlags,tagList,boolMap)(d0/a0/a1)
                                - Builds a "Flag" word from a TagList.
                                  (V36)
RefreshTagItemClones(cloneList,origList)(a0/a1)
                                - Rejuvenates a clone from the original.
                                  (V36)
SDivMod32(dividend,divisor)(d0/d1)
                                - Signed 32 by 32 bit division and modulus.
                                  (V36)
SMult32(factor1,factor2)(d0/d1) - Signed 32 by 32 bit multiply with 32 bit
                                  result. (V36)
Stricmp(string1,string2)(a0/a1) - Case-insensitive string compare. (V37)
Strnicmp(string1,string2,length)(a0/a1,d0)
                                - Case-insensitive string compare, length-
                                  limited. (V37)
TagInArray(tagVal,tagArray)(d0/a0)
                                - Check if a Tag value appears in a Tag
                                  array. (V36)
ToLower(character)(d0)          - Convert a character to lowercase. (V37)
ToUpper(character)(d0)          - Convert a character to uppercase. (V37)
UDivMod32(dividend,divisor)(d0/d1)- Unsigned 32 by 32 bit division and
                                  modulus. (V36)
UMult32(factor1,factor2)(d0/d1) - Unsigned 32 by 32 bit multiply with 32
                                  bit result. (V36)
```

## workbench.library (basename: _WorkbenchBase)

```
AddAppIconA(id,userdata,text,msgport,lock,diskobj,taglist)(d0/d1/a0/a1/a2/a3/
                                a4)
                                - Also stack-based amiga.lib stub
                                  AddAppIcon().  Add an icon to workbench's
                                  list of appicons.        (V36)
AddAppMenuItemA(id,userdata,text,msgport,taglist)(d0/d1/a0/a1/a2)
                                - Also stack-based amiga.lib stub
                                  AddAppMenuItem().  Add a menuitem to
                                  workbench's list of appmenuitems (V36)
AddAppWindowA(id,userdata,window,msgport,taglist)(d0/d1/a0/a1/a2)
                                - Also stack-based amiga.lib stub
                                  AddAppWindow() add a window to workbench's
                                  list of appwindows.  (V36)
RemoveAppIcon(appIcon)(a0)      - Remove an icon from workbench's list
                                  (V36)
RemoveAppMenuItem(appMenuItem)(a0)- Remove a menuitem from workbench's list
                                  (V36)
RemoveAppWindow(appWindow)(a0)  - Remove a window from workbench's list
                                  (V36)
```
