

SoftQuad Panorama 1.0 Release Notes

We have discovered the following problems in Panorama 1.0 (revision 1.11).

1 . Netscape users:

A problem has been identified which makes it impossible to run Panorama with Netscape version 1.2b1. At this time, the only workaround is to use a different version of Netscape.

If you have configured Panorama to work with Netscape, you must not launch Netscape while Panorama is running. This means that:

1. You must not launch Panorama and then try to launch Netscape.
2. You must not launch Netscape, launch Panorama, quit Netscape, and then try to relaunch Netscape while Panorama is still running.

If you do so, you will not be able to launch Netscape again unless you restart MS Windows.

The correct sequence of actions is as follows:

1. Launch Netscape
2. Launch Panorama
3. Browse files using Panorama (which may make a call to the Netscape application that is already running)
4. Quit Panorama
5. Quit Netscape

If you follow this sequence of actions you will have no problem launching Netscape.

2. The Style Sheet Editor does not correctly support the hexadecimal notation for colors (e.g., #AABBCC) as described in the documentation. Please do not use this feature in this release.

3. The maximum value (in pixels) that the Style Sheet Editor will allow you to enter for the Space Above, Space Below, Left Indent, and Right Indent is 999, and not 32767.

4. When printing a document containing a graphic, you may get the error message "GDB Fail". This message has nothing to do with the graphic file format; it appears when the screen driver doesn't support the "Windows GetDIBits API" call. The same document may print successfully from another PC.
