YOUR CHILD CAN BE A GENIUS

The Genius range has been thoroughly tested on numerous PCs,
using a variety of different graphics boards, sound boards and CD-Rom drivers.
It is unlikely you will experience any problems, but should you do so it
could be because your PC has an unusual combination of these devices that
could make it incompatible with the program.

Systest: Included on the disk is a program that tests the suitability of your
system for running the Genius software. Running this may solve any
problems you may be encountering and will suggest changes to your system
for optimum performance.

The program has a number of minimum requirements.
Before calling the Europress Software Helpline, please check whether the
difficulty could be caused by one of the following:

Screen colours: The range uses 256 colours. Your PC should have a Super VGA
card (with at least 512k Video RAM). For best results it should be set to
640x480 with 256 colours.

Screen size: If there is a black border round the book, it means you are
running in a higher resolution than necessary. To make the book fill the
screen change your resolution to 640x480.

Other programs: The Genius range is happier when it is not competing with
other programs. When running the Genius range, we suggest you close down
any other applications.

Networking: It is not advisable to run this program if your PC is attached
to a network. Reload Windows without the network drivers by keying "WIN /N".

Incompatible devices: During the intensive evaluation programme the Genius
range was tested using many different hardware and software devices,
including accelerators and file compression packages, to ensure
compatibility. If you feel a device installed in your PC may be affecting
performance it should be disabled before running the Genius range.

Memory problems: The Genius range requires 8MB to run. You may try inceasing
the size of the swap file on your hard disk is errors persist. To find out
how to do this look up the "386 Enhanced Command" section of your Windows
manual.

[MCI] WAV Audio not working: The genius range relies on playing wave files
to operate properly. If you hear no sound when using the program you may
need to install the Microsoft WAV audio driver. To find out how to do this
look up the "Setting up device drivers for audio compact-disc players"
section of your Windows manual.
