Despite GPDial v1.0 being free of charge it is still © 1996 Adam Wasiak

1.3 GPDial v1.0 - Requirements

Requirements

GPDial requires OS 2.04 or above. It will normally be used in conjunction with AmiTCP.

I developed GPDial using

- o CygnusEd Pro V3.5
- o Lattice C v5.01
- o GadToolsBox v2.0b
- o DPaint 4 AGA
- o BrushCon v1.20

It was tested on an A1200 running

- o WB 3.0
- o AmiTCP v2.2 & 2.3
- o rhslip.device

Note: Although GPDial should run on OS 2.04 it has not been tested on such a machine. It has also not been tested with a ppp.device.

1.4 GPDial v1.0 - What is it

So What Is It?

Well after several hours of installing AmiTCP and finally getting it to work I set about looking for a dialer. There are several dialers out there, but none of them met my needs. So GPDial was born.

GPDial is a script based dialer that has a fancy GUI. It has the capability of storing several entries in its phone book. So if you have more than one service provider, it could be the dialer for you.

GPDial doesn't necessarily have to be used with AmiTCP. It can be used to automate any sequence of events. Especially ones involving the serial port.

1.5 GPDial v1.0 - Installation

Installation

The installation is quite straight forward. There is an installation script that will do everything for you. To run it type

```
installer Install.GPDial
```

or double click on its icon.

The installation script will copy GPDial to a directory of your choice the default is AmiTCP:bin

Replace will then be copied to a directory of your choice the default is C:.. Replace is a find and replace utility. See its doc for more info.

The config files are then copied. GPDial will look for the config file in the following places:

```
The location held in environment variable GPD_CONFIG
AmiTCP:db/
INet:db/
S:
```

The installation script will generate the GPD_CONFIG environment variable for you in ENV: and ENVARC:

The next step involves copying 2 GPDial scripts into a directory of your choice.

Finally the doc files are copied to a place of your choice. The GPDial doc (this file) has 4 iff pictures which will also be copied, it might be best if the guide and the iffs are placed in a directory of their own (it would certainly be neater). The Replace doc is also copied to a directory of your choice.

and thats it.

1.6 GPDial v1.0 - Using GPDial

Using GPDial

GPDial can be run from either the cli or workbench. It must be noted however that GPDial requires a stack of 10000 bytes. This is handled by its icon if run from workbench. If you run it from the cli remember and change the stack with the command:

```
stack 10000
```

I use GPDial from a menu using "tools daemon". This supports different stack sizes.

If GPDial is run from the workbench a window will open. see the User Interface section for more details.

GPDial has a few command line arguments. They are:

```
GPDial [-options] [script | phonebook entry]
```

options

n	No startup script
c	Don't open serial port on startup
e	Run script associated with the phonebook entry

script	Name of a script to run
--------	-------------------------

Normally no arguments are required.

If a script is given then the user interface is not displayed.

GPDial normally opens the serial port as soon as it starts. This can be avoided by using the 'c' flag. (the serial port can be opened latter on with the SETSER script command).

After GPDial has allocated all resources it will attempt to run the startup script (if there is one). To stop this happening use the 'n' flag.

If the 'e' flag is given then the script associated with the phonebook entry is executed. There are several benefits of doing this.

When a script is executed from the User Interface several special variables are filled in. See GPDial Variables section for more details. If a script is executed from the command line a few of these variables are not filled in. This is overcome by using the 'e' flag. It pretends the script has been executed from the interface.

It should be noted that when using the 'e' flag you also enter the phonebook entry name to execute, NOT a script name.

1.7 GPDial v1.0 - User Interface

The User Interface

When GPDial starts the Main window is displayed.

The Config window is used to edit certain details and the name of the startup script.

To add or edit a Phonebook entry the Phonebook edit window is used.

When a script runs the SHOW command will display the Progress window.

The close gadget on the progress window will not terminate the script. It does exactly the same as the HIDE command.

If the abort gadget is clicked the script will terminate. If however the gadget is clicked while the modem is dialing or connected the connection will continue to exist. Abort merely terminates the script.

1.8 GPDial v1.0 - Scripts

GPDial Scripts

Here is a list of all the scripting commands

ACCEPT	- Get input from the user
CLOSE	- Close the serial port
END	- End of the script
EXECUTE	- Execute a command
EXTRACT	- Extract a word from a string
GOTO	- Goto a Label
HIDE	- Hide the progress window
IF	- Selection
MATH	- Do a calculation
PAUSE	- Pause for a length of time
PRINT	- Print a message to the progress window
PRINTERERROR	- Display an error message
QUIT	- Quit the script
REMOVED	- Remove a character from a string
REMOVE	- Remove the progress window
SEND	- Send a string to the serial port
SET	- Set a variable
SETSER	- Change the serial port settings
SHOW	- Show the progress window
WAIT	- Wait for a string from the serial port

Special Control Characters

Several characters can not be displayed normally. In order to display them or send them to the serial port you should use the control character sequence. They are as follows:

\n - Carriage return
\r - Newline

```
\f - Formfeed  
\" - The quote char "  
\$ - The dollar char $  
\ - The slash char \
```

An extra control char is also available to the SEND command:

```
\w - wait for 1 second.
```

Remember to end all commands to the modem with a \r.

1.9 GPDial v1.0 - Scripts - Accept

```
ACCEPT <string> [HIDE] [BLANK] [label]
```

This command will prompt the user for input.

The result is placed in a variable called GPD_INPUT.

If the "HIDE" option is given then the text entered will be hidden (ideal for passwords). The label will be jumped to if "Cancel" is clicked, if it is omitted then the script will continue as if "Ok" was clicked.

Not entering a string in the requester will simulate clicking "Cancel" unless the "BLANK" option is activated.

1.10 GPDial v1.0 - Scripts - Close

```
CLOSE
```

This command will force the release of the serial port.

1.11 GPDial v1.0 - Scripts - End

```
END
```

The end of a script.

1.12 GPDial v1.0 - Scripts - Execute

```
EXECUTE <command> [label]
```

Execute an AmigaDOS command, if the command fails the label will be jumped to.

It should be noted that only system errors will cause control to

jump to the label. If actual command returns an error code it will be ignored.

Any other output from the command will also be ignored.

1.13 GPDial v1.0 - Scripts - Extract

```
EXTRACT <string> <position> [label]
```

This command will take the word at <position> in the <string> and place it in a variable called GPD_VALUE.

The label will be jumped to if there are not enough words in the string for the operation.

e.g.

```
EXTRACT "your IP address is 146.176.164.13" 5  
PRINT $GPD_VALUE
```

gives:

```
146.176.164.13
```

1.14 GPDial v1.0 - Scripts - Goto

```
GOTO <label>
```

Jump to a label. Labels are denoted with the LAB command.

1.15 GPDial v1.0 - Scripts - Hide

```
HIDE
```

This command will hide the progress window.

It can be redisplayed with a SHOW command.

1.16 GPDial v1.0 - Scripts - if/else/endif

```
IF <operand1 operator operand2>  
..  
ELSE  
..  
ENDIF
```

Checks to see if the two operands match.

Valid operators are:

=	Check for equality	- Strings and Numerics.
>	Greater than	- Numerics only.
<	Less than	- Numerics only.
>=	Greater than or equal to	- Numerics only.
<=	Less than or equal to	- Numerics only.
!=	not equal to	- Strings and Numerics.

1.17 GPDial v1.0 - Scripts - Lab

LAB <label:>

This command is normally just skipped over. Other commands use it to allow control to jump to different parts of the script.

1.18 GPDial v1.0 - Scripts - Math

MATH <variable> <=> <operand1> <operation> <operand2>

This command allows you to do simple maths.

Operations are:

+	Plus
-	Subtract
*	Multiply
\	Divide

e.g.

```
SET SUM TO 1
MATH SUM = $SUM + 1
PRINT $SUM
```

gives:

2

1.19 GPDial v1.0 - Scripts - Pause

PAUSE <time>

This command will pause the script for the stated number of seconds. The <time> must be numeric and greater than 0.

A PAUSE length of less than or equal to 0 is invalid.

1.20 GPDial v1.0 - Scripts - Print

PRINT <string>

This command displays a string in the progress window.

1.21 GPDial v1.0 - Scripts - Printerror

PRINTERERROR <string>

This command display the string as an error message.

1.22 GPDial v1.0 - Scripts - Quit

QUIT

This command will quit GPDial.
If the script was run from the GUI it will also be ended.

This command could be used on successful connection to your service provider.

1.23 GPDial v1.0 - Scripts - Remchar

REMCHAR <string> <value>

This command will remove the char at the given position and will shuffle the rest of the chars down.
If you want to remove the last char of the string and you don't know its length you can use a value of -1.

The resultant string is placed in the variable GPD_TEXT

e.g.

```
SET test to "hello there"
REMCHAR $test 6
PRINT $test
```

gives:

hellothere

1.24 GPDial v1.0 - Scripts - Remove

REMOVE [time]

This command removes (closes) the progress window after "time" seconds has expired. It is removed immediately if the time is not stated.

The time value must be greater than 0.

1.25 GPDial v1.0 - Scripts - Send

SEND <string> [HIDE]

This command will send a string to the modem.
A message is displayed in the progress window everytime a SEND is executed. The HIDE flag can be used to stop this. It is ideal for passwords.

1.26 GPDial v1.0 - Scripts - Set

SET <variable> <TO> <string>

This command will set a variable to a string. Numeric variables are also treated in this way

e.g.

```
SET text TO "Hello"
SET value1 TO "1"
SET result TO "0"
MATH result = $value1 + "3"
PRINT $text
PRINT $result
```

gives:

```
Hello
4
```

1.27 GPDial v1.0 - Scripts - Setser

SETSER <baud> <data> <stop> <parity>

This command will open the serial port if it is closed.
It will also change the serial port settings.

baud	-	300
		600
		1200
		2400
		4800
		9600
		19200
		38400
		57600
		76800

115200

data	- 7	7 data bits.
	8	8 data bits.
stop	- 1	1 stop bit.
	2	2 stop bits.
Parity	- N	No parity.
	0	Odd parity
	E	Even parity.

1.28 GPDial v1.0 - Scripts - Show

SHOW [ABORT] [ALL]

This command shows the progress of the connection in a progress window, the options are:

ABORT - This gives an abort button to abort the script. Care should be taken with the abort feature. If it is clicked while the modem is dialing or connected the connection will continue to exist. Abort merely terminates the script.

ALL - This shows ALL output. Normally only PRINT statements and the odd system message will be displayed in the progress window. If ALL is stated then characters received from the modem during a WAIT or WAITLINE are also displayed.

1.29 GPDial v1.0 - Scripts - Wait

WAIT <"string"> [OR <"string"> ...] [timeout <label>] (max of 4 strings)

This command will wait for a string to be received from the serial port. The string received is placed in a variable called GPD_STRING, and the whole line with the string in is placed in a variable called GPD_LINE.

There is a maximum of 4 strings that can be waited for. They are separated with the "OR" statement.

An optional timeout is available. If this time limit runs out before the string is received control jumps to the label.

WAIT will wait for a string to be received and then continue with the script. If however you wish to wait for a whole line (256 chars or newline terminated) then WAITLINE should be used in place of WAIT.

e.g.

WAIT "CONNECT" OR "BUSY" OR "ENGAGED" 30 Error

or

```
WAITLINE "your IP address is" 10 Error
```

1.30 GPDial v1.0 - Variables

GPDial Variables

This is a list of variables that GPDial knows about. More variables can be added by scripts. These are deleted automatically when the script ends.

Variable name	Description	Default value
GPD_BAUD	Holds the current Baud rate	
GPD_DATA	Holds the current number of data bits	
GPD_STOP	Holds the current number of stop bits	
GPD_PARITY	Holds the current parity used	
GPD_INIT	Holds the initialisation string	"AT\r"
GPD_DTROFF	Holds the string to ignore DTR	"AT&D0\r"
GPD_BUSY	Holds the busy string	"BUSY"
GPD_CONNECTED	Holds the connected string	"CONNECT"
GPD_HANGUP	Holds the hangup string	"\w\w++\w\wATH\r"
GPD_PREDIAL	Holds the dial prefix	"ATDT"
GPD_SUFDIAL	Holds the dial suffix	"\r"
GPD_PHONENUMBER	Holds the number of the site that is being called.	
GPD_SITE	Holds the name of the site that is being called. If you don't run the script from the GUI than this variable will be blank.	
GPD_LINE	This variable is filled after every WAIT or WAITLINE command succeeds. It holds the whole line that the command succeeded on.	
GPD_USERNAME	This is the username for the system you are calling. It is filled in from the phonebook. If you don't run the script from the GUI than this variable will be blank.	
GPD_PASSWORD	This is the password for the system	

you are calling. It is filled in from the phonebook. If you don't run the script from the GUI than this variable will be blank.

GPD_STRING	This variable is filled after every WAIT or WAITLINE command succeeds. It holds the actual string that the command succeeded on.	
GPD_VALUE	This variable is filled after every EXTRACT command succeeds	
GPD_TEXT	This variable is filled in by the REMCHAR command.	
GPD_INPUT	This variable will be filled with the results of an ACCEPT.	
GPD_AUTHOR	The name of the author of GPDial	"Adam Wasiak"
GPD_NAME	The name of the program	"GPDial"
GPD_VER	The version information for GPDial	"V1.0 ©1996 GhostSoft"
GPD_REG	Holds the registration details	"<unregistered>"

1.31 GPDial v1.0 - Script Errors

Script Errors

This is a list of error messages that can be produced by incorrect scripts.

Invalid command

You have tried to use a command that GPDial does not understand. It is probably just a spelling mistake (I make them all the time).

Missing LAB:

You tried to do a GOTO to a label that does not exist. This error can be produced by GOTO ACCEPT WAIT or WAITLINE.

PAUSE length incorrect

You entered a PAUSE length that wasn't numeric or was 0.

REMCHAR statement incorrect

The value part of the REMCHAR command is incorrect. It must be either -1 or greater than 0.

Invalid operator

The operator part of the IF statement is incorrect. Valid operators are: = != < > <= >=

Out of memory for SET statement

Your machine ran out of memory while trying to SET a variable.

SET statement incorrect

One of the SET statements is incorrect.

MATH statement incorrect

One of the MATH statements is incorrect.

EXECUTE statement incorrect

One of the EXECUTE statements is incorrect.

EXTRACT statement incorrect

One of the EXTRACT statements is incorrect.

GOTO statement incorrect

One of the GOTO statements is incorrect.

IF statement incorrect

One of the IF statements is incorrect.

LAB statement incorrect

One of the LAB statements is incorrect.

PRINT statement incorrect

One of the PRINT statements is incorrect.

PRINTERERROR statement incorrect

One of the PRINTERERROR statements is incorrect.

SEND statement incorrect

One of the SEND statements is incorrect.

MATH attempted a divide by 0

A MATH statement attempted to divide by 0

MATH variable not declared

Attempted to assign a value to an undeclared variable in a MATH statement.

ACCEPT must have a string

An ACCEPT statement was encounter that did not have a <string>.

Timeout length incorrect

WAIT or WAITLINE timeout length that wasn't numeric or was 0.

<baud> in SETSER is incorrect

The baud rate part of the SETSER command should be:

300
600
1200
2400
4800
9600
19200
38400
57600
76800
115200

<data> in SETSER is incorrect
The data part of the SETSER command should be
7 7 data bits.
8 8 data bits.

<stop> in SETSER is incorrect
The stop part of the SETSER command should be
1 1 stop bit.
2 2 stop bits.

<parity> in SETSER is incorrect
The parity part of the SETSER command should be
N No parity.
O Odd parity.
E Even parity.

Serial device closed
This error occurs when you try to perform an operation on the
serial device when it is closed. It is produced by
SEND
WAIT
WAITLINE

NOTE: SETSER will reopen the serial device if it is closed.

Can't write to serial port
A SEND command failed for some unknown reason.

Can't reopen serial device
One of the SETSER statements has failed to reopen the closed serial port.

SETSER can't change settings
A SETSER command failed to change the serial port settings.

Can't open progress window
One of the SHOW failed to open the progress window.

Too many "OR"s
One of the WAIT or WAITLINE statements has too many ORs.

1.32 GPDial v1.0 - Registration

Registration

This version of GPDial is absolutely free. See disclaimer for more info.

I am currently working on a new version of GPDial. This will be
registration only and available early in April 1996.

The new version will have the following features:

- o Multiple phone numbers per site. (for sites with multiple lines
each with different numbers).
- o Arexx port.

- o More scripting commands.
 - o Logfiles.
 - o Loops.
 - o Ask (YES/NO) requester.
- o Variable progress window size.
- o Enhanced abort processing.
- o Option to use a device other than the serial.device.
- o Hotkey which will bring up the progress window.
- o Encrypted and hidden passwords.
- o Password protection.
- o Any other ideas that are mailed to me.

To register you should send 10 pounds sterling to me.
If you don't have EMail you should also send a S.A.E. big enough to hold a disk. In return I will send you a key file. You will also need to download GPDial1.1_reg.lha.

To register all I will need to know is your name and address. If you have an EMail address you should also send that too. If you are registering on behalf of a company you should also send the company name.

NOTE: v1.1 is still under development and will be released in early April 1996. Any registration fees I receive before then will be held untill it is released.

1.33 GPDial v1.0 - Things you should know about

Things You Should Know About

Here are a few things to watch out for.

1.

Control chars (`\n` `\r` `\` `\"` and `\$`) that occur within the `GPD_INPUT` variable will not be evaluated. This can only happen with the `ACCEPT` command.

e.g.

```
ACCEPT "Enter a string"      ; you entry "Yes\No"
PRINT $GPD_INPUT
```

```
gives    Yes\No
and not  Yes\No
```

2.

Remember commands that go to the modem must end in `\r`.
e.g.

```
SEND "AT\r"
```

3.

The stack must be greater than 4096 - Recommended value is 10000.

4.

When running scripts from the command line it should be noted that several variables are not filled in. Namely:

```
GPD_SITE  
GPD_PHONENUMBER  
GPD_USERNAME  
GPD_PASSWORD
```

If the '-e' option is given the name given is searched for in the phonebook and the relevant details are filled in.

5.

Scripts will run with a closed serial port until a WAIT or SEND command.

If you attempt to run a script and the serial port is closed (either by the -c command line arg or the CLOSE command) the serial port settings for the script (Baud rate, Data bits, Stop bits and Parity) will not be set. However it can be opened latter on with the following command:

```
SETSER $GPD_BAUD $GPD_DATA $GPD_STOP $GPD_PARITY
```

5.

During testing I noticed something strange. Five modem settings don't seem to work. I understand that the serial.device can't handle certain settings. Here are the settings that don't work:

```
8/1/O  
8/1/E  
8/2/O  
8/2/E  
7/1/N
```

I'm not sure if these are the settings that are meant to not work or if there is a bug in the code. If someone knows please mail me.

1.34 GPDial v1.0 - Contacting me

Contacting Me

Send me any bug reports/queries/questions/comments (good or bad). I would like to know if you use this program, send me a postcard or EMail me.

I can be contacted at:

EMail : ghosty@spuddy.mew.co.uk

Snail : Adam Wasiak
10 Chapel Villas
Dalgety Bay
Fife

KY11 5UD

1.35 GPDial v1.0 - Readme.First

This archive should contain the following executables.

GPDial - v1.0 of a script based dialer.
Replace - v1.0 of a find and replace utility.

This archive may be freely distributed.

All software in this archive in © 1996 Adam Wasiak - GhostSoft.

It is recommended you read the installation section of GPDial.guide before you do the install.

NOTE: The GPDial installer will also install the Replace utility for you.
