# Technical Note NW06

## KillNBP Clarification

### CONTENTS

[Introduction](#)[References](#)[Downloadables](#)

This technical note clears up some confusion regarding the Name Binding Protocol KillNBP function.

[Aug 01 1988]

---

## Introduction

The description of the `PKillNBP` function on page 519 of *Inside Macintosh Volume V* is somewhat confusing. The data type of the parameter `thePBptr` is incorrectly given as `ATPPBPtr` and the pointer to the queue element from the NBP call to be aborted is incorrectly given as being passed in `aKillQE1`. The following is a correct description of the `KillNBP` function:

### KillNBP function

FUNCTION PKillNBP (thePBptr: MPPPBPtr; async: BOOLEAN) : OSErr;

Parameter block

-> 26 csCode word Always PKillNBP

-> 28 nKillQE1 pointer Pointer to queue element
