

ABOUT MICROMAT COMPUTER SYSTEMS

MicroMat develops diagnostic and repair-reference software for Macintosh and compatible equipment, in addition to being dedicated to serving Macintosh technicians, consultants and end-users in need of repair software, components, tools, information or service.

MicroMat's first software release, MicroRX for the SE, has helped many technicians pinpoint component-level problems with only a few clicks of the mouse. Cross-referenced to our digital catalog, MicroRX is the most comprehensive guide to Macintosh anatomy available outside of Apple Computer.

MicroMat is the developer of MacEKG, the first Macintosh computer diagnostic commercially available to the general public. MacEKG offers predictive diagnostics which operate at both the system and component level. For more information on MacEKG, see the MacEKG chapter of this document.

For technicians and do-it-yourselfers, MicroMat also offers quality replacement components, assemblies and parts. Our Analog RetroKits are popular with both beginning and experienced technicians as they offer a simple repair procedure for damaged analog boards ranging from the 128K to the SE (including SE30).

In addition to supplying software and parts, MicroMat's warehouse facility in Northern California houses one of the largest Macintosh-only repair depots in the country. Since MicroMat works entirely at the component-level, we offer low prices and rapid restoration of boards, drives and peripherals.
