

## USING THE CONTROL MENU

"Global...": The Set Global Configuration dialog allows you to control several important (conceivably dangerous) features of Comet. See the Global Menu help text. All the other items in the Control Menu affect only the topmost window.

"Window...": The Set Window Configuration dialog allows you to control various features associated with each window, such as whether it will shrink when you switch applications in MultiFinder and the keymapping for the emulator being used.

"Font Size": Allows you to change the font size used on the emulator screen.

"Set Key Pad...": Allows the user to choose which of several keypad configurations will be used. If you are using a Macintosh Standard ADB keyboard, you can use the "Switch Standard keyboard +/- keys to match picture" control to switch the + and - keys to fix the keymapping so it will be the same as in the keypad picture (and in the same position as the + and - keys on other Macintosh keypads).

"Dump Macro keys into edit window...": Dumps the keys which have had key macros defined. If the macro is only a single character, a three digit decimal number is also printed to make it easier to copy and paste the key into the Key macro dialog.

"Set key macros...": Brings up a dialog which allows the user to remap the keyboard and keypad by associating a key with a macro command. (In general, key macros are sequences of characters and commands executed when a key associated with a macro is pressed.) The Help item in the dialog has more information on key macros.

"Key macros on": Switches the use of key macros on and off, so that the standard keyboard interpretation can be easily restored.

"Set Connection macro...": Presents a dialog similar to the key macro dialog which allows you to set a macro command sequence to be executed when a connection is

made. This is useful for partially automating logins, but PLEASE... don't put your passwords in Connection macros!

"Set Double-click macro...": Presents a dialog similar to the key macro dialog which allows you to set a macro command sequence to be executed when you double-click the mouse in the emulator screen. If no Double-click macro is set, Comet will select the current word by default.
