Periodic Table 2.0
by Alan Simon

This DA is a complete Periodic Table in desk accessory form. It is useful primarily for students and chemists. When you choose it, it displays a brief plea for funds; you make this go away by clicking the mouse once. (Somebody surprise me and send the fee, OK?)

After the initial notice, the DA displays a periodic table. Clicking on an element in the table will display it's information on the right. The information is the element's:

• Symbol
• Name
• Atomic Number
• Oxidation states
• Electron configuration
• Atomic weight

The source code for the DA, in TML Pascal, is included in a separate file.
