Apple Slicer

by Jacques Lövi, the raving patcher.

Apple Slicer is a utility which splits the apple menu (☐) into several sub-menus to improve the ergonomy. The menu's items are split into sub-menus on the basis of their alphabetical order :

The installation of Apple Slicer is very easy to do : simply copy the Apple Slicer file into the system folder. To deinstall, simply move it out of this folder.

Although tested for over a year, no problems appeared with other applications or application on all types of macintoshes. Only version 1.2.10 of SuitCase II is incompatible with Apple Slicer when the SuitCase option which places its item at the top of the Apple Menu is set.

Apple Slicer runs on all types of macintoshes where system 6 or later is installed.

In the future, the version 2.0 of Apple Slicer will allow the capability to configure your sub-menus as you want. All the people which will have bought the version 1.0 will receive a free upgrade to version 2.0.

Please note that system 7 doesn't accept more than 52 items in the 'Apple Items' folder ! More items won't appear in the apple menu, with or without Apple Slicer 1.0. Version 2.0 will bypass this limitation.

This version of Apple Slicer is shareware, which means that if after testing the program for a week you decide to keep it, you must send me US\$20. You may give this version of Apple Slicer to all your friends.
