Control Panel Device Eliminated

Previous releases of PseudoFPU used a check box in the Control Panel to determine whether applications used PseudoFPU. This feature allowed the user to disable PseudoFPU for the very few applications that it might slow down. The only known applications of this type are Excel and DataDesk. PseudoFPU 1.1 checks for these applications explicitly, and never reports the presence of an FPU to them, so they always run at maximum speed. Thus the checkbox no longer appears in PseudoFPU 1.1.

Version 1.1 contains an on/off switch in the Control Panel, which determines whether PseudoFPU loads at startup time or not.
