Chapter 1

Screen

1.1 Screen

```
PureBasic Screen library

  Screens are well know on the Amiga as it's the base of the display.
  The AmigaOS can handle any numbers of screens at the same time and
  any screens can have its own properties (width, height, depth...)
  Same screens can be used for both games or applications.

Commands summary:

   CloseScreen
   CreateDualPlayField
   FindScreen
   FindFrontScreen
   FlashScreen
   HideScreen
   InitScreen
   OpenScreen
   RemoveDualPlayField
   ScreenBarHeight
   ScreenDepth
   ScreenFontHeight
   ScreenHeight
   ScreenID
   ScreenMouseX
   ScreenMouseY
   ScreenRastPort
   ScreenViewPort
   ScreenWidth
   ShowScreen
   UseScreen

Example:

   Open screens
```

1.2 createdualplayfield

```
  SYNTAX
CreateDualPlayField(BitMapID)

  COMMAND
Create a secondary playfield on the current screen with the
specified 'BitMapID'. The 'DualPlayField' is a possibility to
split the screen in two zones, a back and a front one, each
totally independant of the other. Each zone has its own bitmap.
You can change the background bitmap with the command
'ShowBackBitMap()'. The colour 0 is the transparent colour.
The screen depth can't be superieur to 3 on OCS/ECS chip (8 colours)
and superior to 4 on AGA chipset (16 colours). Each zones can have
its own palette, so you can have upto 32 colours on a 16 colours
screen (Nice ? :-).

You must call the 'RemoveDualPlayField()' command before closing
the screen or before to quit. This is not done automatically !
```

1.3 removedualplayfield

```
  SYNTAX
RemoveDualPlayField()

  COMMAND
Remove the 'DualPlayField' feature of the current screen.

You must call the 'RemoveDualPlayField()' command before closing
a DualPlayField screen or before to quit. This is not done automatically !
```

1.4 findscreen

```
  SYNTAX
ScreenID.l = FindScreen(#Screen, ScreenName$)

  COMMAND
Find the default public screen and return  its  ScreenID  pointer.
If the ScreenID is NULL, no public screens can be found.

You can specify a ScreenName$, so it will look in the public screen
list to show if the screen is opened, and if so, will catch it !

#Screen = Number to indentifie the screen later.
ScreenName$ = Name of the screen to find. If null name passed "", it will
return the default public screen.
```

1.5 findfrontscreen

```
  SYNTAX
ScreenID.l = FindFrontScreen(#Screen)

  COMMAND
Find the front most screen  and  return  its  ScreenID. If the
ScreenID is NULL, no screens can be found (!).

#Screen = Number to indentify the screen later.
```

1.6 wbtoscreen

```
  SYNTAX
ScreenID.l = WbToScreen(#Screen)

  FUNCTION
Try to find the Workbench screen and return its ScreenID. If the
ScreenID is NULL, the Workbench screen is not found.

#Screen = Number to indentify the screen later.
```

1.7 openscreen

```
  SYNTAX
ScreenID.l = OpenScreen(#Screen, Width, Height, Depth, TagList)

  FUNCTION
Open a new screen and return its ScreenID. If the ScreenID is NULL,
the screen can't be opened. The newly-opened screen becomes the
currently used screen (no need for UseScreen() function).

  #Screen = Number to indentify the screen later.

NOTE: The 'Small_AmigaOS' resident file must be loaded when compiling
       (all theses constants are inside).

Availables Tags:

  #SA_Left
  #SA_Top
  #SA_Width
  #SA_Height
      The defaults for the #SA_Left, #SA_Top, #SA_Width, and
      #SA_Height tags end up being a bit complex.  If none of
      these tags are specified, and no NewScreen structure is
      used, then the left/top/width/height correctly match the
      display clip of your screen (see #SA_DClip and
      #SA_Overscan).

      The difficulty comes with overscanned screens, because the
      normal value of #SA_Left or #SA_Top for such a screen may be
      non-zero.  If a NewScreen structure is supplied, then the
```

left/top/width/height come originally from there. If no NewScreen structure is supplied, but a non-default #SA_Width (#SA_Height) is specified, then #SA_Left (#SA_Top) defaults to zero instead. In these cases, the left and top edge may not be what you want.

If you need to specify explicit width or height, or supply a NewScreen, you must supply correct values for #SA_Left and #SA_Top. The correct normal values are the display clip rectangle's MinX and MinY values respectively. If you are using the #SA_DClip tag, then you already have a rectangle to consult for these values. If you are using #SA_Overscan to get one of the standard overscan types, you may use QueryOverscan() to get a rectangle for that overscan type.

#SA_Depth (defaults to 1)
#SA_DetailPen (defaults to 0)
#SA_BlockPen (defaults to 1)
#SA_Title (defaults to NULL)
#SA_Font (defaults to NULL, meaning user's preferred monospace font)
#SA_BitMap (whose existence also implies CUSTOMBITMAP).

Several tags are Booleans, which means that depending on whether their corresponding ti_Data field is zero (FALSE) or non-zero (TRUE), they specify Boolean attributes. The ones corresponding to Boolean flags in the NewScreen.Type field are:

#SA_ShowTitle (defaults to TRUE)
#SA_Behind (equiv. to SCREENBEHIND) (defaults to FALSE)
#SA_Quiet (equiv. to SCREENQUIET) (defaults to FALSE)

The following tags provide extended information to Intuition when creating a screen:

#SA_Type: ti_Data corresponds to the SCREENTYPE bits of the NewScreen.Type field. This should be one of PUBLICSCREEN or CUSTOMSCREEN. The other bits of the NewScreen.Type field must be set with the appropriate tags (#SA_Behind, #SA_Quiet, etc.)

#SA_DisplayID: ti_Data is a 32-bit extended display mode ID, as defined in the <graphics/modeid.h> include file (V39 and up) or in <graphics/displayinfo.h> (V37 and V38).

#SA_Overscan: ti_Data contains a defined constant specifying one of the system standard overscan dimensions appropriate for the display mode of the screen. Used with the Width and Height dimensions STDSCREENWIDTH and STDSCREEN, this makes it trivial to open an overscanned or standard dimension screen. You may also hand-pick your various dimensions for overscanned or other screens, by specifying screen position and dimensions explicitly, and by using #SA_DClip to explicitly specify an overscanned DisplayClip region.

The values for ti_Data of this tag are as follows:

OSCAN_TEXT - Text Overscan region. A region which is completely on screen and readable ("text safe"). A preferences data setting, this is backward equivalent with the old MoreRows, and specifies the DisplayClip and default dimensions of the Workbench screen. This is the default.

OSCAN_STANDARD - Also a preferences setting, this specifies a rectangle whose edges are "just out of view." This yields the most efficient position and dimensions of on-monitor presentations, such as games and artwork.

OSCAN_MAX - This is the largest rectangular region that the graphics library can handle "comfortably" for a given mode. Screens can smoothly scroll (hardware pan) within this region, and any DisplayClip or Screen region within this rectangle is also legal. It is not a preferences item, but reflects the limits of the graphics hardware and software.

OSCAN_VIDEO - This is the largest region that the graphics library can display, comfortable or not. There is no guarantee that all smaller rectangles are valid. This region is typically out of sight on any monitor or TV, but provides our best shot at "edge-to-edge" video generation.

Remember, using overscan drastically effects memory use and chip memory bandwidth. Always use the smallest (standard) overscan region that works for your application.

#SA_DClip: ti_Data is a pointer to a rectangle which explicitly defines a DisplayClip region for this screen. See QueryOverscan() for the role of the DisplayClip region.

Except for overscan display screens, this parameter is unnecessary, and specifying a standard value using #SA_Overscan is normally an easier way to get overscan.

#SA_AutoScroll: this is a Boolean tag item, which specifies that this screens is to scroll automatically when the mouse pointer reaches the edge of the screen. The operation of this requires that the screen dimensions be larger than its DisplayClip region.

#SA_PubName: If this field is present (and ti_Data is non-NULL), it means that the screen is a public screen, and that the public screen name string is pointed to by ti_Data. Public screens are opened in "PRIVATE" mode and must be made public using PubScreenStatus(screen, 0).

#SA_Pens: The ti_Data field (if non-NULL) points to a UWORD array of pen specification, as defined for struct DrawInfo. This array will be used to initialize the screen's DrawInfo.dri_Pens array.

#SA_Pens is also used to decide that a screen is ready to support the full-blown "new look" graphics. If you want the 3D embossed look, you must provide this tag, and the ti_Data value cannot be NULL. If it points

```
    to a "minimal" array, containing just the terminator ~0,
    you can specify "new look" without providing any values
    for the pen array.

    The way the DrawInfo pens are determined is Intuition
    picks a default pen-array.  Then, any pens you supply with
    #SA_Pens override the defaults, up until the ~0 in your
    array.

    If the screen is monochrome or old-look, the default will
    be the standard two-color pens.

    If the screen is two or more planes deep, the default will
    be the standard four-color pens, which now include the
    new-look menu colors.

    If the screen has the #SA_LikeWorkbench property, the
    default will be the user's preferred pen-array, changeable
    through preferences.

The following two tag items specify the task and signal to be issued
to notify when the last "visitor" window closes on a public screen.
This support is to assist envisioned public screen manager programs.

#SA_PubTask:  Task to be signalled.  If absent (and #SA_PubSig is
    valid), use the task which called OpenScreen() or
    OpenScreenTagList()).

#SA_PubSig:  Data is a UBYTE signal number (not flag) used to notify
    a task when the last visitor window closes on a public screen.

#SA_Colors: ti_Data points to an array of ColorSpec structures
    (terminated with ColorIndex = -1) which specify initial
    values of the screen's color palette.

#SA_FullPalette: this is a Boolean attribute.  Prior to V36, there
    were just 7 RGB color values that Intuition maintained
    in its user preferences (playfield colors 0-3, and colors
    17-19 for the sprite).  When opening a screen, the color
    map for the screens viewport is first initialized by
    graphics (graphics.library/GetColorMap()) then these
    seven values are overridden to take the preferences values.

    In V36, Intuition maintains a full set of 32 preferences colors.
    If you specify TRUE for #SA_FullPalette, Intuition will
    override ALL color map entries with its full suite of
    preferred colors.  (Defaults to FALSE).

#SA_ErrorCode: ti_Data points to a ULONG in which Intuition will
    stick an extended error code if OpenScreen[TagList]() fails.
    Values are of this include 0, for success, and:
    OSERR_NOMONITOR - monitor for display mode not available.
    OSERR_NOCHIPS   - you need newer custom chips for display mode.
    OSERR_NOMEM     - couldn't get normal memory
    OSERR_NOCHIPMEM - couldn't get chip memory
    OSERR_PUBNOTUNIQUE  - public screen name already used
    OSERR_UNKNOWNMODE   - don't recognize display mode requested
```

```
    OSERR_TOODEEP   - screen too deep to be displayed on
              this hardware (V39)
    OSERR_ATTACHFAIL    - An illegal attachment of screens was
              requested (V39)

    NOTE: These values are not the same as some similar return
    values defined in graphics.library/ModeNotAvailable().

#SA_SysFont: ti_Data selects one of the system standard fonts
    specified in preferences.  This tag item overrides the
    NewScreen.Font field and the #SA_Font tag item.

    Values recognized in ti_Data at present are:
    0 - old DefaultFont, fixed-width, the default.
    1 - Workbench screen preferred font.  You have to
        be very font sensitive to handle a proportional or
        larger than traditional screen font.

    NOTE WELL: if you select sysfont 1, windows opened on
    your screen will not inherit the screen font, but rather
    the window RastPort will be initialized to the old-style
    DefaultFont (sysfont 0).

Attached screen tags:  V39 supports attached screens, where
    one or more child screens can be associated with a parent
    screen.  Attached screens depth-arrange as a group, and
    always remain adjacent depth-wise.  Independent
    depth-arrangement of child screens is possible through
    the V39 ScreenDepth() call.  If a child screen is
    made non-draggable through {#SA_Draggable, FALSE}, then
    it will drag exclusively with the parent.  Normal child
    screens drag independently of the parent, but are pulled
    down when the parent is.  Use the #SA_Parent, #SA_FrontChild,
    and #SA_BackChild tags to attach screens.

#SA_Parent:  If you wish to attach this screen to an
    already-open parent screen, use this tag and set
    ti_Data to point to the parent screen.  See also
    #SA_FrontChild and #SA_BackChild.  (V39).

#SA_FrontChild:  If you wish to attach an already-open child
    screen to this screen, set ti_Data to point to the child
    screen.  The child screen will come to the front of the
    family defined by the parent screen you are opening.  See
    also #SA_Parent and #SA_BackChild.  (V39)

#SA_BackChild:  If you wish to attach an already-open child
    screen to this screen, set ti_Data to point to the child
    screen.  The child screen will go to the back of the family
    defined by the parent screen you are opening.  See also
    #SA_Parent and #SA_FrontChild.  (V39)

#SA_BackFill:  ti_Data is a pointer to a backfill hook for
    the screen's Layer_Info.
    (see layers.library/InstallLayerInfoHook()).  (V39).

#SA_Draggable:  ti_Data is a boolean.  Set to FALSE if you
```

wish your screen to be non-draggable. This tag should be used very sparingly!. Defaults to TRUE. For child screens (see #SA_Parent, #SA_FrontChild, and #SA_BackChild) this tag has a slightly different meaning: non-draggable child screens are non-draggable with respect to their parent, meaning they always drag exactly with the parent, as opposed to having relative freedom. Also see ScreenPosition(). (V39)

#SA_Exclusive: ti_Data is a boolean. Set to TRUE if you never want your screen to share the display with another screen. This means that your screen can't be pulled down, and will not appear behind other screens that are pulled down. Your screen may still be depth arranged, though. Use this tag sparingly! Defaults to FALSE. Starting with V40, attached screens may be #SA_Exclusive. Setting #SA_Exclusive for each screen will produce an exclusive family. (V39).

#SA_SharePens: For those pens in the screen's DrawInfo->dri_Pens, Intuition obtains them in shared mode (see graphics.library/ObtainPen()). For compatibility, Intuition obtains the other pens of a public screen as PENF_EXCLUSIVE. Screens that wish to manage the pens themselves should generally set this tag to TRUE. This instructs Intuition to leave the other pens unallocated. Defaults to FALSE. (V39).

#SA_Colors32: Tag to set the screen's initial palette colors at 32 bits-per-gun. ti_Data is a pointer to a table to be passed to the graphics.library/LoadRGB32() function. This format supports both runs of color registers and sparse registers. See the autodoc for that function for full details. Any color set here has precedence over the same register set by #SA_Colors. (V39).

#SA_Interleaved: ti_Data is a boolean. Set to TRUE to request an interleaved bitmap for your screen. Defaults to FALSE. If the system cannot allocate an interleaved bitmap for you, it will attempt to allocate a non-interleaved one (V39).

#SA_VideoControl: ti_Data points to a taglist that will be passed to VideoControl() after your screen is open. You might use this to turn on border-sprites, for example. (V39).

#SA_ColorMapEntries: ti_Data is the number of entries that you wish Intuition to allocate for this screen's ColorMap. While Intuition allocates a suitable number for ordinary use, certain graphics.library features require a ColorMap which is larger than default. (The default value is 1<<depth, but not less than 32). (V39)

#SA_LikeWorkbench: ti_Data is boolean. Set to TRUE to get a screen just like the Workbench screen. This is the best way to inherit all the characteristics of the Workbench, including depth, colors, pen-array, screen mode, etc. Individual attributes can be overridden through the

```
        use of tags.  (#SA_LikeWorkbench itself overrides things
        specified in the NewScreen structure).  Attention
        should be paid to hidden assumptions when doing this.  For
        example, setting the depth to two makes assumptions about
        the pen values in the DrawInfo pens.  Note that this
        tag requests that Intuition ATTEMPT to open the screen
        to match the Workbench.  There are fallbacks in case
        that fails, so it is not correct to make enquiries about
        the Workbench screen then make strong assumptions about
        what you're going to get.  (Defaults to FALSE).  (V39)

    #SA_MinimizeISG:  ti_Data is boolean.  For compatibility,
        Intuition always ensures that the inter-screen gap is at
        least three non-interlaced lines.  If your application
        would look best with the smallest possible inter-screen
        gap, set ti_Data to TRUE.  If you use the new graphics
        VideoControl() VC_NoColorPaletteLoad tag for your screen's
        ViewPort, you should also set this tag.  (V40)
```

1.8 screenmousex

```
  SYNTAX
x.w = ScreenMouseX()

  FUNCTION
Returns the mouse position, in pixels, relative to the left of the
current screen.
```

1.9 screenmousey

```
  SYNTAX
y.w = ScreenMouseY()

  FUNCTION
Returns the mouse position, in pixels, relative to the top of the
current screen.
```

1.10 screendepth

```
  SYNTAX
Result.w = ScreenDepth()

  FUNCTION
Returns the depth of the current screen.
```

1.11 screenwidth

```
  SYNTAX
width.w = ScreenWidth()

  FUNCTION
Returns the width, in pixels, of the current screen.
```

1.12 screenheight

```
  SYNTAX
height.w = ScreenHeight()

  FUNCTION
Returns the height, in pixels, of the current screen.
```

1.13 showscreen

```
  SYNTAX
ShowScreen()

  STATEMENT
Bring the current screen to the front of the display.
```

1.14 hidescreen

```
  SYNTAX
HideScreen()

  STATEMENT
put the current screen to the back of the display.
```

1.15 usescreen

```
  SYNTAX
UseScreen(#Screen)

  STATEMENT
Change the current screen to the given #Screen.
```

1.16 screenviewport

```
  SYNTAX
Result.l = ScreenViewPort()

  FUNCTION
```

```
Returns the viewport of the current screen. This function is written
to enable you to get the screen's viewport and should be used only
by advanced programmers who want access to all the OS functions.
```

1.17 screenbarheight

```
  SYNTAX
Result.b = ScreenBarHeight()

  FUNCTION
Return the used screen menu bar height. Useful to adjust windows
just under it (for example).
```

1.18 screenfontheight

```
  SYNTAX
Result.b = ScreenFontHeight()

  FUNCTION
Returns the font height of the current screen.
```

1.19 wbordertop

```
  SYNTAX
Result.b = WBorderTop()

  FUNCTION
Returns the window border-top which will be opened on this
screen. The result includes the Font height, ie the border
window with a title.
```

1.20 nwborderbottom

```
  SYNTAX
Result.b = NWBorderBottom

  FUNCTION
Returns the window border-bottom which will be opened on this screen.
```

1.21 closescreen

```
  SYNTAX
CloseScreen(#Screen)

  STATEMENT
Close the given screen.
```

1.22 initscreen

```
  SYNTAX
result.l = InitScreen(#NumScreenMax)

  FUNCTION
Init all the Screen environments for later use.  You  must  put  this
function at the top of your source code if you want to use the NScreen
commands.You can test the result to see if the Window environment is
correctly initialized.

#NumScreenMax : Maximum number of screens to handle.
```

1.23 screenid

```
  SYNTAX
ScreenID.l = ScreenID()

  FUNCTION
Returns the Intuition Screen pointer. Very useful.
```

1.24 screenrastport

```
  SYNTAX
ScreenRP.l = ScreenRastPort()

  FUNCTION
Returns the current Screen RastPort. It allows you to use the 2D Drawing
fonctions directly on the screen's bitmap:

Example

  DrawingOutput(ScreenRastPort()) ; Set the drawing function output
                                  ; on the current screen

  BoxFill(10, 10, 100, 100)       ; This box will be drawn on the screen
```

1.25 flashscreen

```
  SYNTAX
FlashScreen()

  FUNCTION
Flash the current screen.
```
