### 1.2 RxCD Introduction

Introduction

This library contains low level functions to manipulate audio cd. Note that your cd soft or hard device might refuse to perform some operation.

A cd device is referred by a name, e.g. CD0 CD2, or by an unique cd descriptor id returned by CDCreate().

You may use CDCreate() for speed reasons if in your macro you use a lot of RxCD functions calls.

You have to use CDCreate() anytime you want to add an interrupt.

So the first argument of any CDXXX() function will always be a cd definition:

- o id - the id returned by CDCreate()
- o cd - a cd name or an id
- o cdName - a cd name, not an id

The second argument of most CDXXX() functions is an ARexx stem name.

---

It is used to store error informations; quite all functions return an integer:

- o 0  
Success

- o >0  
Failure

On failure, if you have supplied a valid second argument, there will be set the fields:

- o DevErr  
The exec.library device error
- o Status  
The SCSI2 Status
- o CC  
The Check Condition flag of Status. This is very important.
- o ASCIISense  
The sense data in ascii format
- o Valid
- o ErrorCode  
Always 0x 70x 71x
- o SegmentNumber
- o FileMark
- o EOM
- o ILI
- o SenseKey  
The type of the error
- o Error  
The SenseKey in human form
- o Information
- o ASL
- o CSI
- o ASC  
With ASCQ you can know what happen
- o ASCQ
- o Reason  
The ASC/ASCQ in human form

- o FRUC
- o SKSV
- o SKS

See sense format.

Audio cd programming is not that easy. Different hardware devices and exec.library software devices may react in different mode.

Info about SCSI2 standard may be found at  
<http://www.uni-mainz.de/~tacke/scsi/SCSI2-index.html>

## 1.3 RxCD Author

### Author

I am Alfonso Ranieri

My e-mail address is alforan@tin.it

My home page is at <http://web.tiscalinet.it/amiga/>

## 1.4 RxCD Warning, Requirements, Installation and Distribution

### Warning, Requirements, Installation and Distribution

#### Warning

THIS SOFTWARE AND INFORMATION ARE PROVIDED AS IS.  
ALL USE IS AT YOUR OWN RISK, AND NO LIABILITY OR  
RESPONSIBILITY IS ASSUMED. NO WARRANTY IS MADE,

#### Requirements

The library needs:  
o AmigaOS, version 3 or higher

#### Installation

- o Run the installer script
- o The library dispatch offset is -30

#### Distribution

RxCD is Freeware

You are free to distribute it as long as the original archive  
is kept intact. Commercial use or its inclusion in other  
software package is prohibited without prior written consent  
from the Author.

---

## 1.5 RxCD Terms

### Terms

The main terms used in this guide are:

- o id  
The device descriptor as returned by CDCCreate()
- o cd  
An AmigaDOS device name or an id
- o cdName  
An AmigaDOS device name
- o track  
A sub-division of the CD-ROM media. A disc has from 1 to 99 tracks. The data within a track are always of the same type. A track can be either CD-ROM or CD-Audio.  
A disc can start at any track number.
- o index  
An index is a subdivision of a CD-ROM track. A track can have from 1 to 99 index numbers. Index numbers within a track are sequential starting with 1.
- o address  
Physical address of a frame on a cd
- o frame  
1/75 of a second. A physical sector on CD-ROM media.  
Also the F field unit of a MSF CD-ROM address
- o MSF  
Minutes/Seconds/Frames rappresents an address on a cd  
addr = m\*75\*60 + S\*75 + F
- o stem or stemName  
A valid ARexx variable name e.g. var var.0 var.name
- o types of arguments:

D	any data	--	
N	numeric	/N	ARexx integral number
S	symbol	/S	ARexx valid symbol
V	stemName	/V	As S but with length<32

## 1.7 RxCD Functions - CDCCreate

CDCCreate - creates a cd object

Synopsis  
id = CDCCreate(cdName)  
<cdName>

Function  
Creates an internal cd object and returns its descriptor.

Inputs  
cdName - audio cd device name

Result  
id - an integer:

---

0 - failure, a RxCD error code in RC  
>0 - success, a valid cd descriptor

See

CDDispose()

## 1.8 RxCD Functions - CDDispose

CDDispose - disposes a cd object

Synopsis

```
call CDDispose(id)
<id/N>
```

Function

Disposes an internal cd object created with CDCCreate().

Inputs

id - audio cd device descriptor

Result

Always returns 0.

See

CDCCreate()

## 1.9 RxCD Functions - CDAddChangeInt

CDAddChangeInt - adds a change-disk interrupt

Synopsis

```
sig = CDAddChangeInt(id)
<id/N>
```

Function

Adds a change interrupt so that anytime 'id' is open/closed, your macro is signaled via 'sig'.

Warning: your cd exec.library device may refuse to add the interrupt.

Inputs

id - audio cd device descriptor

Result

res - 0 on failure with in RC the device Error,  
the signal to wait otherwise.

See

CDRemChangeInt()

## 1.10 RxCd Functions - CDRemChangeInt

CDRemChangeInt – removes a change-disk interrupt

Synopsis

```
call = CDRemChangeInt (id)
<id/N>
```

Function

Removes a change-disk interrupt added by CDAddChangeInt().

Inputs

id – a device descriptor

Result

res – always 0

See

CDAddChangeInt()

## 1.11 RxCd Functions - CDAddFrameInt

CDAddFrameInt – adds a frame interrupt

Synopsis

```
sig = CDAddFrameInt (id)
<id/N>
```

Function

Adds a frame interrupt so that anytime 'id'  
is playing and the current frame changes your  
macro is signaled via 'sig'.

Warning: your cd exec.library device will  
refuse to add the interrupt for sure :-)  
It means mainly that to control the  
playing you have to poll like all cd  
players do.

Inputs

id – audio cd device descriptor

Result

res – 0 on failure with in RC the device Error,  
the signal to wait otherwise.

See

CDRemFrameInt()

## 1.12 RxCd Functions - CDRemFrameInt

CDRemFrameInt - removes a change-disk interrupt

Synopsis

```
call = CDRemFrameInt(id)
<id/N>
```

Function

Removes a frame interrupt added by CDAddFrameInt().

Inputs

id - a device descriptor

Result

res - always 0

See

CDAddFrameInt()

## 1.13 RxCD Functions - CDEject

CDEject - ejects a cd

Synopsis

```
res = CDEject(cd, status)
<cd>, [status/N]
```

Function

Ejects or injects a cd.

Warning: your cd exec.library device may refuse to eject the cd. You should us CDStartStop() to perform this operation.

Inputs

```
cd      - audio cd device name or descriptor
status - 0 inject, 1 eject
```

Result

res - 0 on success a RxCD error code otherwise with in RC the device Error

See

CDPause() CDStartStop()

## 1.14 RxCD Functions - CDPause

CDPause - pause/continue a cd

Synopsis

```
res = CDPause(cd, debug, status)
<cd>, <debug/V>, [status/N]
```

Function  
Pauses or continues a cd.

Inputs  
cd - audio cd device name or descriptor  
debug - an ARexx stem name  
status - 0 pause, 1 continue

Result  
res - 0 on success a RxCD error code otherwise

See  
CDEject() CDStartStop()

## 1.15 RxCD Functions - CDStartStop

CDStartStop - starts/stops a cd

Synopsis  
res = CDStartStop(cd, debug, l, s)  
<cd>, <debug/V>, [l/N], [s/N]

Function  
Ejects or injects a cd.

Inputs  
cd - audio cd device name or descriptor  
debug - an ARexx stem name  
l s action  
-----  
0 0 stop  
0 1 ready  
1 1 load  
1 0 eject

Result  
res - 0 on success a RxCD error code otherwise

See  
CDEject() CDPause()

## 1.16 RxCD Functions - CDPlay

CDPlay - plays a cd by a track pair

Synopsis  
res = CDPlay(cd, debug, fromTrack, toTrack)  
<cd>, <debug/V>, [fromTrack/N], [toTrack/N]

Function  
Plays a cd starting from 'fromTrack' track to 'toTrack' track

Default for 'fromTrack' is 1.

Default for 'toTrack' is 99 (MAX standard number of tracks).

#### Inputs

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
fromTrack - the track to start at  
toTrack - the track to stop at

#### Result

res - 0 on success a RxCD error code otherwise

#### See

CDPlay10() CDPlay12() CDPlayMSF()  
CDPlayTrackIndex() CDPlaytrackRelative10() CDPlaytrackRelative12()

## 1.17 RxCD Functions - CDPlay10

CDPlay10 - plays a cd by address/len

#### Synopsis

res = CDPlay10(cd, debug, absAddr, shortLen)  
<cd>, <debug/V>, [absAddr/N], [shortLen/N]

#### Function

Plays a cd starting at long 'absAddr' address for short 'shortLen' frames.

#### Inputs

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
absAddr - the address to start at  
shortLen - the short frames to play

#### Result

res - 0 on success a RxCD error code otherwise

#### See

CDPlay() CDPlay12() CDPlayMSF()  
CDPlayTrackIndex() CDPlaytrackRelative10() CDPlaytrackRelative12()

## 1.18 RxCD Functions - CDPlay12

CDPlay12 - plays a cd by address/len

#### Synopsis

res = CDPlay12(cd, debug, absAddr, longLen)  
<cd>, <debug/V>, [absAddr/N], [longLen/N]

#### Function

Plays a cd starting at long 'absAddr' address for long 'longLen' frames.

Inputs

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
absAddr - the address to start at  
longLen - the long frames to play

Result

res - 0 on success a RxCD error code otherwise

See

CDPlay() CDPlay10() CDPlayMSF()  
CDPlayTrackIndex() CDPlaytrackRelative10() CDPlaytrackRelative12()

## 1.19 RxCD Functions - CDPlayMSF

CDPlayMSF - plays a cd by MSF pair

Synopsis

```
res = CDPlayMSF(cd, debug, startMin, startSec, startFrame, endMin, endSec, endFrame)
      <cd>, <debug/V>, [startMin/N], [startSec/N], [startFrame/N], [endMin/N], [endSec/N ↵]
      , [endFrame/N]
```

Function

Plays a cd from 'startMin'-'startSec'-'startFrame' to 'endMin'-'endSec'-'endFrame'.

It means that the function plays the cd from the addr startMin+60\*75+startSec\*75+startFrame to the addr endMin+60\*75+endSec\*75+endFrame .

Inputs

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
startMin - the minute to start at  
startSec - the second to start at  
startFrame - the frame to start at  
endMin - the minute to stop at  
endSec - the second to stop at  
endFrame - the frame to stop at

Result

res - 0 on success a RxCD error code otherwise

See

CDPlay() CDPlay10() CDPlay12()  
CDPlayTrackIndex() CDPlaytrackRelative10() CDPlaytrackRelative12()

## 1.20 RxCD Functions - CDPlayTrackIndex

CDPlayTrackIndex - plays a cd by track/index pair

Synopsis

```
res = CDPlayTrackIndex(cd, debug, startTrack, startIndex, endTrack, endIndex)
      <cd>, <debug/V>, [startTrack/N], [startIndex/N], [endTrack/N], [endIndex/N]
```

Function

Plays a cd starting at track 'startTrack' index 'startIndex'  
to track 'endTrack' index 'endIndex'.

Inputs

cd	- audio cd device name or descriptor
debug	- an ARexx stem name
startTrack	- the track to start at
startIndex	- the index (inside 'startTrack') to start at
endTrack	- the track to stop at
endIndex	- the index (inside 'endTrack') to stop at

Result

res - 0 on success a RxCD error code otherwise

See

```
CDPlay() CDPlay10() CDPlay12()
CDPlayMSF() CDPlaytrackRelative10() CDPlaytrackRelative12()
```

## 1.21 RxCD Functions - CDPlayTrackRelative10

CDPlayTrackRelative10 - plays a cd by track/addr/len

Synopsis

```
res = CDPlayTrackRelative10(cd, debug, relAddr, track, shortLen)
      <cd>, <debug/V>, [relAddr/N], [track/N], [shortLen/N]
```

Function

Plays a cd starting at address 'relAddr' relative to the  
track 'track' for short 'shortLen' frames.

Inputs

cd	- audio cd device name or descriptor
debug	- an ARexx stem name
relAddr	- the address, relative to 'track', to start at
track	- the track 'relAddr' is relative to
shortLen	- the short frames to play

Result

res - 0 on success a RxCD error code otherwise

See

```
CDPlay() CDPlay10() CDPlay12()
CDPlayMSF() CDPlayTrackIndex() CDPlaytrackRelative12()
```

## 1.22 RxCD Functions - CDPlayTrackRelative12

CDPlayTrackRelative12 – plays a cd by track/addr/len

Synopsis

```
res = CDPlayTrackRelative11(cd, debug, relAddr, track, longLen)
<cd>, <debug/V>, [relAddr/N], [track/N], [len/N]
```

Function

Plays a cd starting at address 'relAddr' relative to the track 'track' for long 'longLen' frames.

Inputs

cd – audio cd device name or descriptor  
debug – an ARexx stem name  
relAddr – the address to start at, relative to 'track'  
track – the track 'relAddr' is relative to  
longLen – the long frames to play

Result

res – 0 on success a RxCD error code otherwise

See

CDPlay() CDPlay10() CDPlay12()  
CDPlayMSF() CDPlayTrackIndex() CDPlaytrackRelative10()

## 1.23 RxCD Functions - CDCDDB4String

CDCDDB4String – returns CDDB protocol-4 query string

Synopsis

```
res = CDCDDB4String(cd)
<cd>, <debug/V>, <var/S>
```

Function

Retrieves CDDB protocol-4 query string

Inputs

cd – audio cd device name or descriptor  
debug – an ARexx stem name  
var – an ARexx var name where to store result

Result

res – 0 on success a RxCD error code otherwise

See

CDToc()

## 1.24 RxCD Functions - CDInfo

CDInfo – retrieves CD driver informations

**Synopsis**

```
res = CDInfo(cd, debug, stem)
<cd>, <debug/V>, <stem/V>
```

**Function**

Retrieves CD driver informations, writing in 'stem' the fields:

- o PeripheralQualifier
- o PeripheralType
- o Removable
- o Modifier
- o Iso
- o Ecma
- o ANSI
- o AENC
- o TrmIOP
- o Rdf
- o ALength
- o RelAddr
- o Wbus32
- o Wbus16
- o Sync
- o Linked
- o CmdQueue
- o SoftReset
- o Vendor
- o Product
- o Revision

**PeripheralQualifier:**

- o 000b The specified peripheral device type is currently connected to this logical unit. If the target cannot determine whether or not a physical device is currently connected, it shall also use this peripheral qualifier when returning the INQUIRY data. This peripheral qualifier does not mean that the device is ready for access by the initiator.
- o 001b The target is capable of supporting the specified peripheral device type on this logical unit; however, the physical device is not currently connected to this logical unit.
- o 010b Reserved
- o 011b The target is not capable of supporting a physical device on this logical unit. For this peripheral qualifier the peripheral type shall be set to 1Fh to provide compatibility with versions of SCSI. All other peripheral device type are reserved for this peripheral qualifier.
- o 1XXb Vendor-specific

**PeripheralType:**

- o 00h Direct-access device (e.g. magnetic disk)
- o 01h Sequential-access device (e.g. magnetic tape)
- o 02h Printer device
- o 03h Processor device
- o 04h Write-once device (e.g. some optical disks)
- o 05h CD-ROM device
- o 06h Scanner device
- o 07h Optical memory device (e.g. some optical disks)
- o 08h Medium changer device (e.g. jukeboxes)
- o 09h Communications device

- o 0Ah - 0Bh Defined by ASC IT8 (Graphic arts pre-press devices)
- o 0Ch - 1Eh Reserved
- o 1Fh Unknown or no device type

Of course, we are interested to 05h device type (hummm maybe to 08h ?).

#### Inputs

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
stem - where to write the fields

#### Result

res - 0 on success a RxCD error code otherwise

#### See

CDModeSense()

## 1.25 RxCD Functions - CDModeSense

CDModeSense - retrieves current media parameters

#### Synopsis

```
res = CDModeSense(cd, debug, stem)
<cd>, <debug/V>, <stem/V>
```

#### Function

Retrieves current media parameters, writing in stem the fields:

- o DataLength
- o MediumType
- o Empty
- o Opened
- o Specific
- o BDlength
- o PS
- o Immed
- o Sotc
- o APRVal
- o LBA
- o PBS
- o Out0
- o Vol0
- o Out1
- o Vol1
- o Out2
- o Vol2
- o Out3
- o Vol3

MediumType codes:

- o 00h Default (only one type supported)
- o 01h 120 mm CD-ROM data only
- o 02h 120 mm CD-DA audio only
- o 03h 120 mm CD-ROM data and audio combined
- o 04h Reserved

- o 05h 80 mm CD-ROM data only
- o 06h 80 mm CD-DA audio only
- o 07h 80 mm CD-ROM data and audio combined
- o 08h - 7Fh Reserved
- o 80h - FFh Vendor-specific

**Inputs**

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
stem - where to write the fields

**Result**

res - 0 on success a RxCD error code otherwise

**See**

CDInfo()

## 1.26 RxCD Functions - CDStatus

CDStatus - retrieves the cd status

**Synopsis**

```
res = CDStatus(cd, debug, stem)  
<cd>, <debug/V>, <stem/V>
```

**Function**

Retrieves the cd status, writing in stem the fields:

- o AudioStatus/N
- o Play
- o Pause
- o Complete
- o DLength
- o Adr
- o PreEmphasis
- o CopyPerm
- o Audio
- o 4Channels
- o Track
- o Index
- o AbsAddr
- o RelAddr

**AudioStatus codes:**

- o 00h - Audio status byte not supported or not valid
- o 11h - Audio play operation in progress
- o 12h - Audio play operation paused
- o 13h - Audio play operation successfully completed
- o 14h - Audio play operation stopped due to error
- o 15h - No current audio status to return

**Inputs**

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
stem - where to write the fields

```
Result
res - 0 on success a RxCD error code otherwise
```

## 1.27 RxCD Functions - CDToc

CDToc - reads the table of contents

Synopsis

```
res = CDToc(cd, debug, stem)
<cd>, <debug/V>, <stem/V>
```

Function

Reads the table of contents, writing in stem the fields:

- o FirstTrack  
First track index. Note that this may not be 1.
- o LastTrack  
Last track index. Valid tracks are FirstTrack, ..., LastTrack
- o StartAddr  
Where the first track starts
- o EndAddr  
Where the last track ends
- o Frame  
Size of the cd in frames
- o Min  
Size of the cd in minutes and seconds
- o Sec
- o ID  
The CDDB proto4 ID of the disk
- o Num  
The number of the tracks

And int stem.i , i=0,...,NUM-1

- o Track  
Track number. Note that this may be not i+1
- o Startaddr  
Address of the track
- o Frames  
Size of the track in frames
- o StartMin  
Where the track starts in MSF
- o StartSec

- o Startframe
- o Min  
size of the track in MSF
- o Sec
- o Frame
- o Audio  
This track is an audio track
- o PreEmphasis
- o CopyPerm
- o 4Channels

**Inputs**

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
stem - where to write the fields

**Result**

res - 0 on success a RxCD error code otherwise

**See**

CDCDDBString()

## 1.28 RxCD Functions - CDRequestSense

CDRequestSense - returns sense data

**Synopsis**

```
res = CDRequestSense(cd, debug)
<cd>, <debug/V>
```

**Function**

Asks to the device for the sense data.

**Inputs**

id - a device descriptor

**Result**

sense - the sense data  
debug - an ARexx stem name

## 1.29 RxCD Functions - CDTTestUnit

CDTTestUnit - tests unit ready

**Synopsis**

```
res = CDTTestUnit(cd,debug)
<cd>,<debug/V>
```

**Function**

Tests if the cd unit is ready.  
You should do something like:

```
cd = CDCCreate("cd0")
call CDTTestUnit(cd)
sense = CDSense(cd)
/* check the sense data here */
```

**Inputs**

cd - audio cd device name or descriptor  
debug - an ARexx stem name

**Result**

res - an ARexx boolean

## 1.30 RxCD Functions - CDVolume

CDVolume - changes audio volumes

**Synopsis**

```
res = CDVolume(cd,debug,leftVol,rightVol)
<cd>,<debug/V>,[leftVol/N],[rightVol/N]
```

**Function**

Changes audio volume. Note that not all cd hardware devices support the software volume control.

**Inputs**

cd - audio cd device name or descriptor  
debug - an ARexx stem name  
leftVol - left volume (0,...255)  
rightVol - right volume (0,...255)

**Result**

res - 0 on success a RxCD error code otherwise

## 1.31 RxCD Functions - GetRxCDString

GetRxCDString - returns a RxCD error string

**Synopsis**

```
string = GetRxCDString(code)
<code/N>
```

**Function**

Returns the error associated with code.

The error string defined are:

Code	Short	String
51	[NO MEM]	too few memory
52	[ARG MISS]	required argument missed
53	[BAD NUMBER]	bad number
54	[BAD VALUE]	bad value
55	[NO DEVICE]	device not found The device doesn't exist
56	[NO SIGNAL]	no signal available Exec signals are over
57	[CANT OPEN DEVICE]	can't open device The device cannot be opened
58	[DEVICE ERROR]	device error The device returned an error
59	[NO CD]	device is not a CD-ROM The device is not a CD-ROM
60	[BADTOC]	invalid TOC format Can't read this TOC

#### Inputs

code - the code to obtain the string associated with

#### Returns

string - the string associated with code

## 1.32 RxCD Functions - Help

Help - returns RxCD functions help strings

#### Synopsis

```
help=help(funName)
<funName>
```

#### Function

Returns the arguments mask string of rxcld.library function 'funName'.

#### Inputs

funName - a RxCD function name

#### Result

help - the help string associated with 'funName'

## 1.33 RxCD FAQ

### FAQ

- How to check for a cd rom device:

```
if CDInfo(cd, "db", "info")=0 then iscd=(info.PeripheralType==5)
else iscd=0
```

- How to check for a anytype cd inserted:

```
if CDModeSense(cd, "db", "MS")=0 then iscdin=(and(a.MediumType, 112)==0)
else iscdin=0
```

- How to check for an audio cd inserted:

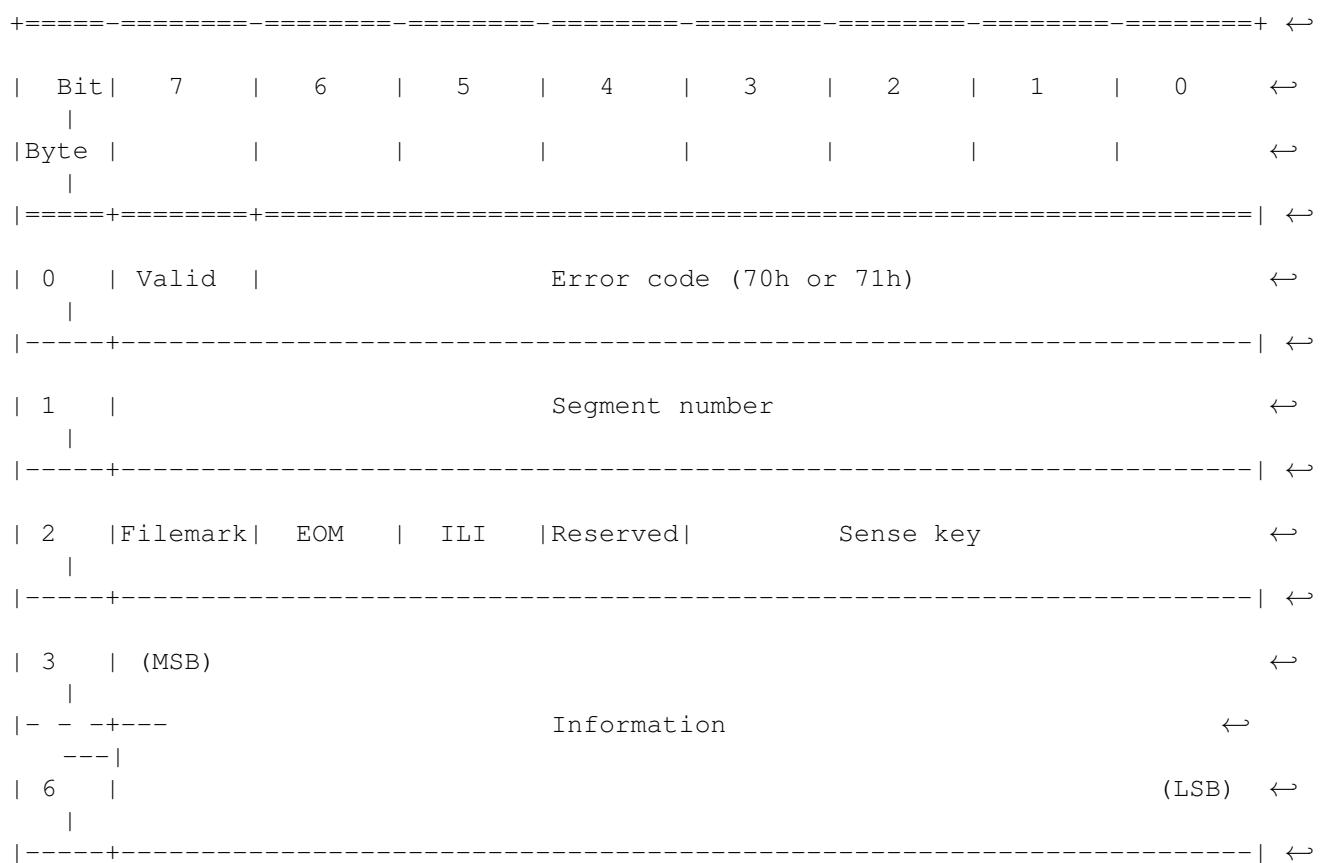

```
if CDModeSense(cd, "db", "MS")=0 then isaudiocdin=(and(a.MediumType, 2)~=0)
else isaudiocdin=0
```

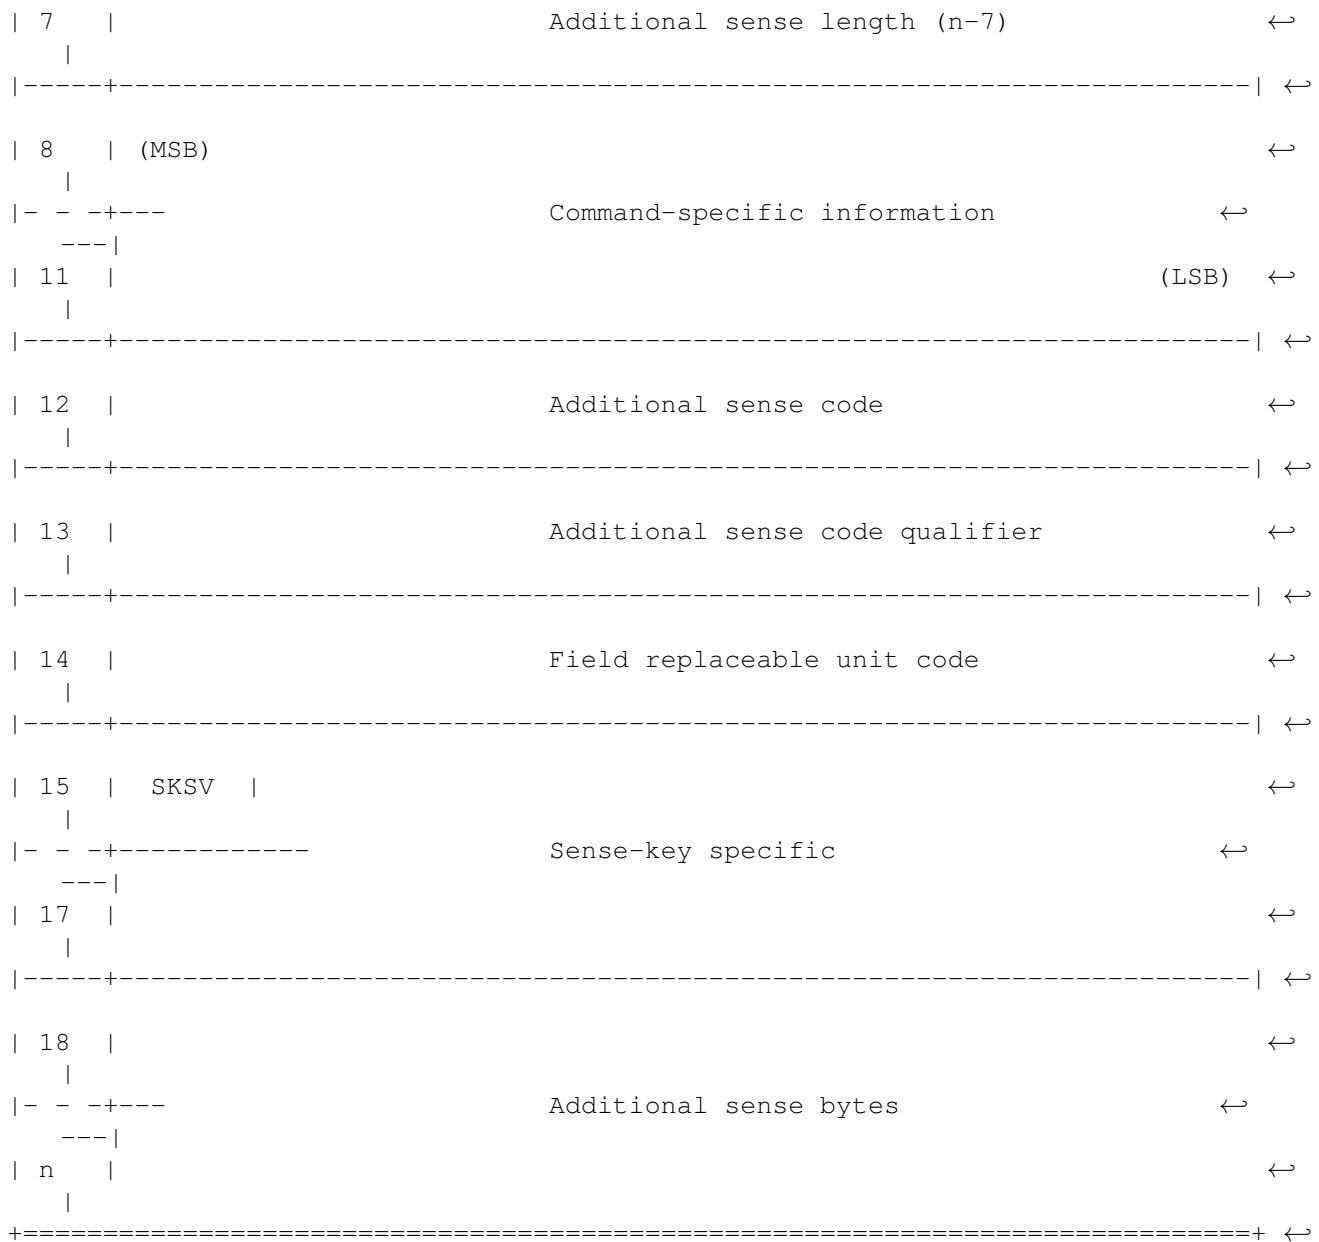

- How to check for a data cd inserted:

```
if CDModeSense(cd, "db", "MS")=0 then isdatacdin=(and(a.MediumType, 1)~=0)
else isdatacdin=0
```

## 1.34 RxCD Sense

### Sense

**Sense key**

Sense key	
Sense	Description
key	
0h	NO SENSE. Indicates that there is no specific sense key information to be reported for the designated logical unit. This would be the case for a successful command or a command that

| | received CHECK CONDITION or COMMAND TERMINATED status because one ↵  
| | of the filemark, EOM, or ILI bits is set to one. ↵  
|-----+-----| ↵

| 1h | RECOVERED ERROR. Indicates that the last command completed ↵  
| | successfully with some recovery action performed by the target. ↵  
| | Details may be determinable by examining the additional sense ↵  
| | bytes and the information field. When multiple recovered errors ↵  
| | occur during one command, the choice of which error to report ↵  
| | (first, last, most severe, etc.) is device specific. ↵  
|-----+-----| ↵

| 2h | NOT READY. Indicates that the logical unit addressed cannot be ↵  
| | accessed. Operator intervention may be required to correct this ↵  
| | condition. ↵  
|-----+-----| ↵

| 3h | MEDIUM ERROR. Indicates that the command terminated with a non- ↵  
| | recovered error condition that was probably caused by a flaw in ↵  
| | the medium or an error in the recorded data. This sense key may ↵  
| | also be returned if the target is unable to distinguish between a ↵  
| | flaw in the medium and a specific hardware failure (sense key 4h) ↵  
| . | . ↵  
|-----+-----| ↵

| 4h | HARDWARE ERROR. Indicates that the target detected a non- ↵  
| | recoverable hardware failure (for example, controller failure, ↵  
| | device failure, parity error, etc.) while performing the command ↵  
| | or during a self test. ↵  
|-----+-----| ↵

| 5h | ILLEGAL REQUEST. Indicates that there was an illegal parameter in ↵  
| | the command descriptor block or in the additional parameters ↵  
| | supplied as data for some commands (FORMAT UNIT, SEARCH DATA, ↵  
| | . | . ↵  
|-----+-----| ↵

|       | etc.). If the target detects an invalid parameter in the command ←  
|       | descriptor block, then it shall terminate the command without ←  
|       | altering the medium. If the target detects an invalid parameter ←  
|       | in the additional parameters supplied as data, then the target may ←  
|       | have already altered the medium. This sense key may also indicate ←  
|       | that an invalid IDENTIFY message was received (6.6.7). ←  
|  
|-----+-----| ←  
| 6h    | UNIT ATTENTION. Indicates that the removable medium may have been ←  
|       | changed or the target has been reset. ←  
|-----+-----| ←  
| 7h    | DATA PROTECT. Indicates that a command that reads or writes the ←  
|       | medium was attempted on a block that is protected from this ←  
|       | operation. The read or write operation is not performed. ←  
|-----+-----| ←  
| 8h    | BLANK CHECK. Indicates that a write-once device or a sequential- ←  
|       | access device encountered blank medium or format-defined end-of- ←  
|       | data indication while reading or a write-once device encountered a ←  
|       | non-blank medium while writing. ←  
|-----+-----| ←  
| 9h    | VENDOR-SPECIFIC. This sense key is available for reporting vendor ←  
|       | specific conditions. ←  
|-----+-----| ←  
| Ah    | COPY ABORTED. Indicates a COPY, COMPARE, or COPY AND VERIFY ←  
|       | command was aborted due to an error condition on the source ←  
|       | device, the destination device, or both. (See 8.2.3.2 for ←  
|       | additional information about this sense key.) ←  
|-----+-----| ←  
| Bh    | ABORTED COMMAND. Indicates that the target aborted the command. ←

## ASC and ASCQ assignments

- | D - DIRECT ACCESS DEVICE
- | . T - SEQUENTIAL ACCESS DEVICE
- | . L - PRINTER DEVICE
- | . P - PROCESSOR DEVICE
- | . . W - WRITE ONCE READ MULTIPLE DEVICE
- | . . R - READ ONLY (CD-ROM) DEVICE
- | . . S - SCANNER DEVICE
- | . . O - OPTICAL MEMORY DEVICE
- | . . M - MEDIA CHANGER DEVICE
- | . . C - COMMUNICATION DEVICE

	ASC	ASQ	DTLPWRSOMC	DESCRIPTION		↔
