```
-------------------------------------------------------------------------
  TXDB  HELP.DOC       Function-Keys, Internal (line DRAWING Editor)
-------------------------------------------------------------------------
```

 (F1) Help
 A short look at the function keys and their functions.
 By pressing the ESC-Key you can leave Help and the last
 textfile will be shown on the screen.

 (F2) Call external wordprocessor or editor
 The (F2)-key will call up an external editor together with the
 current text file. Which editor is used will be specified at
 the start. Examples for this are in the two START*.BAT files.
 All editors can be combined with each other. After leaving the
 editor you go automatically back to the program.

 (F3) Delete the current text-file.

 (F4) Copy temporary sample file (stored in $MUSTER.TXT)
 The textfile which is shown on the screen can be copied (F4) in a
 temporary file. Also with (F4) the content of the temporary
 file can be assigned to a new, not existing, planned work-file,
 if e.g. a connection to a not existing, planned file is tried or the
 current file just has been deleted. With sample-files for graphics,
 tables, textpieces, etc. you are able to reduce your amount of work.

 (F5) Alternative Paths
 The programm is able to work with two paths. With the (F5)-key you
 are able to change between the two paths. At the bottom of the
 screen is PATH-1 or PATH-2 written. So e.g., the user is able to
 read a document and simultanously write his notes.

 (F6) Select home page
 Return to the home page from every position, which is stored in the
 file "$BASIS.TXT"

 (F7) Show Path
 Up to 20 of the last shown filenames will be stored.
 With the (F7)-key the user gets a list, where he is able to select
 textfiles with the keys (a), (b), ...

 (F8) Marked Texts
 With the (F8)-key filenames of marked files will be shown in a list.
 The user is always able to mark the current textfile with the key-
 combination (.) and (0) to (9) . Maximal 10 marked files can
 directly be selected out of the list.

 (F9) Internal Editor
 With (F9), the internal editor will be called. The size of one text
 is maximal 24 Rows and 78 Columns. Formated or longer texts can't
 be edited by using the internal editor.
 The internal editor should be used for short notes, etc. (you must
 not wait). Other texts could be edited with an external editor or
 textsystem.

 (F10) Quit Program

 (-) Minus-key, back on the path

Go back to the last shown textpages. You can go back maximal
20 files.

>> Set marks: key "." and (0) - (9) , show marked files with "F8"

>> Select direct $A.TXT - $Z.TXT with key "." and "A" - "Z"

Syntax for connections :   (1)_filename   -> filename.txt
or hypertext references

Special references   :   (2)_&&-list1   -> AB-list1.txt
-----------------------   (3)_&&-list2   -> AB-list2.txt

... from a text page with the filename "ABCDE.TXT"
TXDB replaces "&&" with the two first charaters of the actual
filename. You can copy "checklists", to a new filename, the
reference names depends from the new filename.

Syntax for "shell" to
external DOS program :   (1)_(dir *.doc)
----

                           (2)_(view-pcx pict-01.pcx)

                               "view-pcx" stands here for a
                               separat PCX-viewer programm
                               of your choice, PCX-viewer are
                               not contained in this system

                           (3)_(copy *.txt a:)   ... and more

("shell" not on HP200LX Palmtops!)

TXDB internal (line DRAWING) editor:
      +-----------------------+------------------+
      | Editor Functions | Key-combination |
      +-----------------------+------------------+
      | � delete a ROW | |
      | and store it | (Ctrl.+Y) |
      | � insert the deleted | |
      | ROW | (Ctrl.+C) |
