

## Macintosh DOS v.1.3.0 Docs.

MacintoshDOS is a macintosh emulation of MS-DOS 6.2. Its purpose is to show you what DOS is like, provided you don't know, or would like to find out how I see it. Now , if you really like MS-DOS then don't get offended by what you may find, if you do its your own fault, its like playing with Beelzebub. See what I mean? You probably don't. Anyhow it operates the same way DOS does , however it does not do all the really crappy comands that involve copying ect, its just a little thing that shows what is like, but of course its entirely interactive.

Its like navigating throughout a FTP site if that helps.

The commands MacintoshDos understands:

`cd .`-This will take you back one directory.

`cd ..`-this will also take you back one directory.

`tree`- this will show a file and folder tree of the current directory.

`mem`-displays the memory stuff like selecting "About this

macintosh".

`exit` or `quit`-quits MacintoshDOS.

`cd +whatever directory`-this goes into the directory specified, it must be typed with no uppercase letters and the same spelling as you see

it. to change to a directory name GAMES you would type this: `cd games` and then hit return.

`dir` or `dir/p`- shows you whats in the current directory.

If you type the name of a file in all lowercase letters in the same spelling with the type begin `.EXE` then it will do the equivalent of launching an application, the same way as in the real DOS.

The file entitled "ABOUT" is a file about the program and would be opened by just typing "`about`" at the `C:/>` prompt.

I personally do not believe in pay crap loads of money for crappy programs that you

don't even get shrinkwrapped so this program is **BUCKWARE**. So, if you keep this program and playwith it all you have to do is send me one stinkin' dollar (U.S.) do the address below.

So, send all your comments,suggestions, hate-mail, kill IBMs, and money to:

Jake Bouvrie
