

Setup has detected that you have other Internet communications software loaded on your PC. Setup needs to rename the WINSOCK.DLL files associated with this software in order to install the CompuServe Internet Dialer. You can cancel the installation process and rename the existing WINSOCK.DLL files manually, or you can allow Setup to rename them for you. Setup will store a list of renamed files in FILECHG.TXT.

You may also choose to uninstall the existing Internet software. If you do so, check to see if this existing software has modified your AUTOEXEC.BAT, WIN.INI, or SYSTEM.INI files.

Note: If you are currently accessing the Internet through a LAN, renaming an existing WINSOCK.DLL file may disable LAN Internet access. Contact the LAN administrator before making the above changes. I
