

## MicroMachines 2

### How to install the tracks

When you have downloaded the tracks you want, just go to the directory where you downloaded them to. Then unzip them using pkunzip, (pkunzip -d megabana.zip x:\ if you want to install KS Megabana). You must unzip it to the root of a drive, because it will make a directory called mm2cdat there, and put the track-file in that directory. Then start Micro Machines 2, go to the disk options menu in the construction kit and select install course. Choose the drive that you unzipped the track to, and then select the course. When the track is installed, delete the directory x:\mm2cdat. Any troubles, then mail me.
