

# LegalPoint for Windows

## Common Questions

**Q: Why do the background and button graphics look fuzzy?**

A: If the graphics look a bit fuzzy, you are probably running windows at VGA resolution. This means that Windows has only 16 colors available for drawing graphics. The office backdrop, and the translucent buttons of the main menu, are photo-realistic images, which require 256 colors to display properly. The fuzzyness results from trying to display a 256 color image when there are only 16 colors available, and is nothing to be alarmed about.

**Q: What happens if I accidentally overwrite the "master" copy of a document?**

A: Don't worry, you can't. It's impossible to overwrite a master copy from within LegalPoint. In fact, there is nothing that you can do from LegalPoint that will do any harm to any of LegalPoint's files. Because LegalPoint looks and feels like a word processor, several people have expressed concern about overwriting the "master" or "original" copy of a document. Don't worry- when you create a new document, you are not working with the "master" copy. LegalPoint creates a copy of the "master" and lets you work on the copy.
