

Help on Installing EXEsafe

You are about to install EXEsafe 2. There are a number of screens in this installation, which must each be passed to complete it. To move from one screen to the next, click on 'Next >'.

Select Installation Directory

This is the folder that the EXEsafe program files will actually go in. The default for this is in your program files directory. This is normally fine, but you can change it if you wish to.

Select Start Menu Folder

This is the folder within the start menu under which the program appears. Again, the pre-entered options are acceptable, but if you wish to change it, you may.

Select Icons to Create

You are then given the option of creating a desktop icon and/or a quick launch icon. To use one of these, make sure its box is ticked, otherwise make sure the tick is removed.

Ready to Install Files

This shows you the options that you have selected. You can go '< Back' to change these options before you actually install.

Copy Files

The installation program will automatically copy the files to your hard drive, and create shortcuts.

Installation Complete

At this point, the installation has completed, and you will be given the option of launching EXEsafe immediately.
