Upgrading: There is no need to uninstall previous versions of SyncBack or SyncBackSE. All profiles from SyncBack will be imported automatically when SyncBackSE is first run. Both SyncBack and SyncBackSE can be installed on the same machine. Note that in some cases the sub-directory selections cannot be entirely imported. If this happens a warning dialog is displayed.

SyncBackSE is a file backup & synchronization program that can be used with hard drives, rewritable CD's & DVD's (formatted with UDF), removable media (e.g. Compact Flash), FTP servers, ZIP archives, and network shares. It's easy to use, but includes many options for the power user. SyncBackSE is an enhanced version of the freeware SyncBack software. New features include the ability to copy locked files, faster backups, and an enhanced FTP engine which supports SSL and MODE Z compression.
