

Entrust Technologies is a new company formed by Northern Telecom Limited to capitalize on opportunities in the growing market for enterprise-wide security products. Entrust Technologies develops the Entrust family of software security products for encryption and digital signature with fully automated key management. Security is made affordable by providing a single security infrastructure shared across a variety of applications. Entrust works on any size client/server networks and on Windows, Macintosh or UNIX platforms. High-level APIs also allow easy integration into applications such as e-mail, electronic funds transfers, and database transactions. Additional features include support for a range of optional hardware tokens. Entrust products are used throughout financial, government and high technology industries and has been selected as the security technology of choice for companies such as IBM, Tandem and Hewlett Packard. Entrust Technologies is also one of the world's leading developers in public-key cryptography, security architectures and international standards.
