Company Background:

TACTICA Corporation is a privately owned and venture capital funded software company with headquarters in Portland, Oregon. Tactica's charter is to provide innovative and easy to use software products that efficiently integrate the tasks performed by mobile workers, remote offices, corporate partners, and customers into the business processes of the enterprise.

Presentation Overview:

An off-line transaction processing (OFTP) system is a counterpart of an on-line transaction processing (OLTP) system. The main differences between the two are that i) clients connect only occasionally to the server over a wide area network (WAN); ii) the activity transaction duration in the OFTP application is often much longer than in the OLTP case due mainly to the characteristics of the activities.

Caprera is a suite of software products designed specifically to enable business organizations to build, deploy, and manage OFTP applications such as they are able to integrate external participants into their enterprises. Information is vital to the success of any business operation, especially for business operating in the open WAN environment. To achieve total confidence in information security both off-line as well as during transmission is not an easy task. It requires a well planned security policy, including procedures to prevent unauthorized physical access to computing equipment, proper education on security issues, as well as the technologies to guarantee the security of the information during transmission.
