

## Full Screen Video Playback

Are you tired of teeny weeny, itty bitty video playing in a box? Well, you don't have to settle for miniature multimedia any longer. Windows 95 has implemented a new and improved full screen video playback option for Media Player.

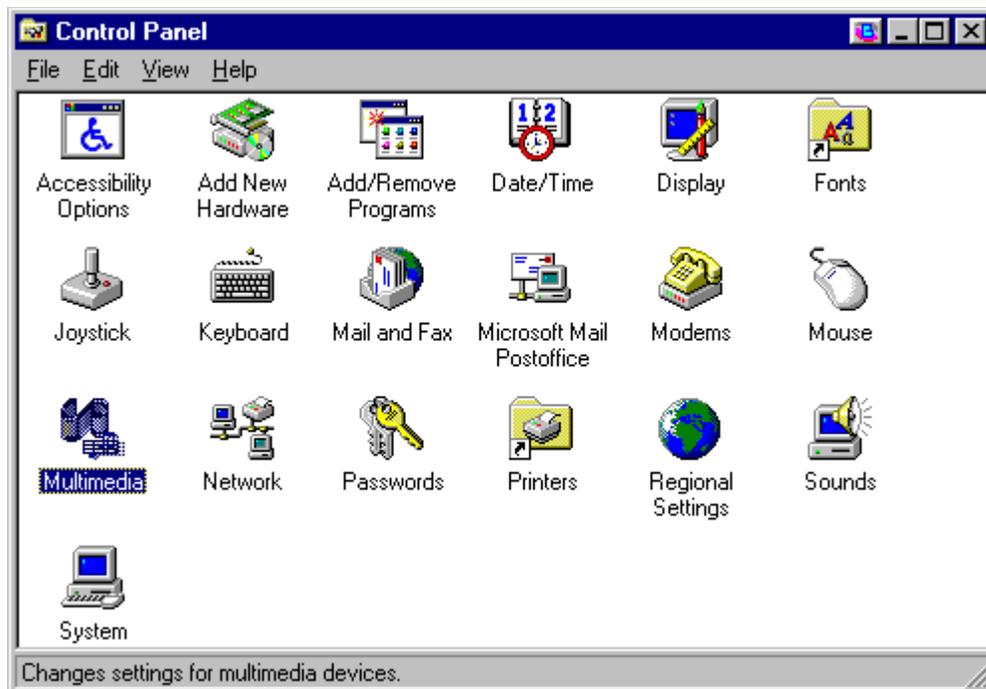

To see a demonstration of full screen video, you'll have to change a few settings first. If you are currently running Windows 95, click and hold on the Start button on the left side of your Task Bar. You'll see this menu appear:

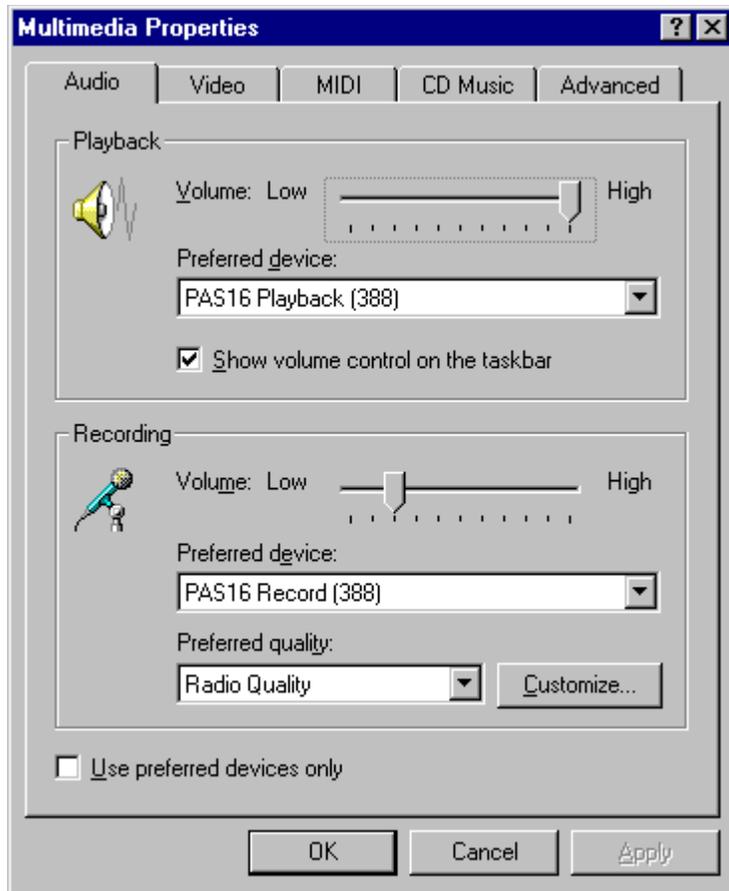

Click on the Settings item and this menu will pop out:

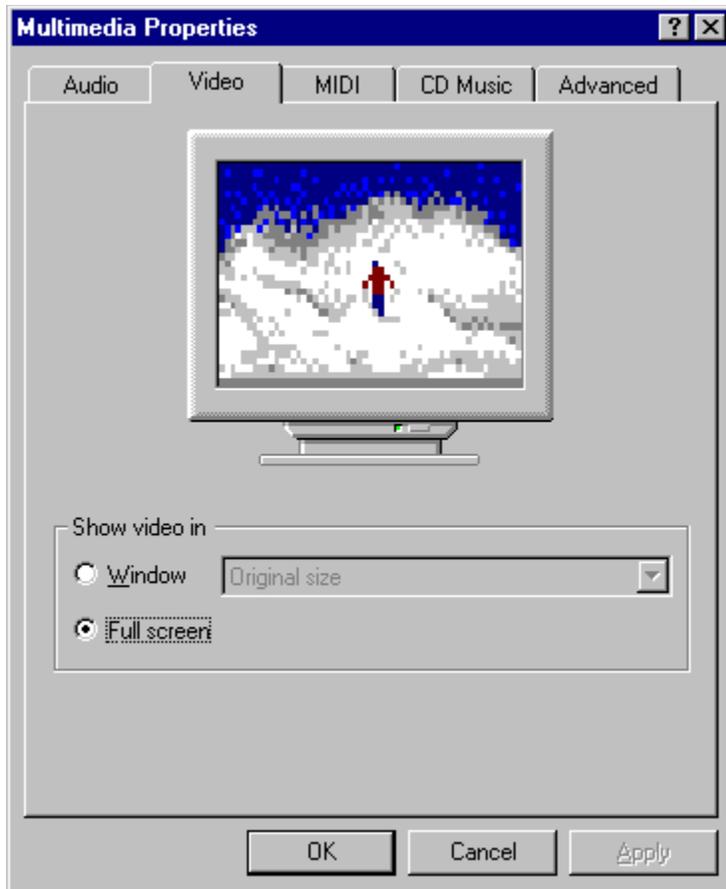

Now, double click on the Control Panel folder and you'll see this window:

Double click on the Multimedia icon:

Now, choose Video by clicking on the Video tab at top of the window:

Click on the Full Screen radio button and then click OK.

**[Now, click here and STAND BACK!!!](#)**

Remember to change your settings back to normal if you want Media Player to play a video at the original size.

If you are not running Windows 95, click to view a still frame of the video at **normal** (160x120) and **full screen** (640x480) size.
