

The Chandelier **Ýview** is a collection of **stalactites** and **draperies**. In the foreground are visible many pieces of rock which are evidence of 'cave breakdown,' which happened when water that filled this cave as it was formed thousands of years ago drained. **Ýview** Sulfuric acid sculpted the cave and left behind a characteristic byproduct **gypsum**. Pieces of gypsum that have been eroded by dripping water are located nearby, leaving spires that look similar to stalagmites. Also within view is **flowstone**, **Ýview boneyard** **Ýview** and some small **ribbons**. **Ýview**
