

ield (field pointer) -> Number
ield (file number; field number) -> Pointer

Pg 43-6

field pointer	Pointer	Pointer to a field
file number	Number	File number
field number	Number	Field number

Field has two different forms.

If passed file number and field number, **Field** returns a pointer to the field.

If passed field pointer, **Field** returns the field number of the field.

The following example sets the **FieldPtr** variable to a pointer to the second field in the third file:

FieldPtr := Field (3; 2)

Using the first form of the **Field** command on **FieldPtr** returns the number 2. For example, the following line sets **FieldNum** to 2:

FieldNum := Field (FieldPtr)

The following example sets the **FieldNum** variable to the field number of **[File3] Field2**:

FieldNum := Field (»[File3]Field2)
