
object	Field	Text object to highlight or variable
first	Number	First position of highlight
last	Number	Last position of highlight

HIGHLIGHT TEXT moves the cursor to object and highlights a section of the text in text object. HIGHLIGHT TEXT will go to text object if the cursor is not in text object. This command cannot be used with fields in included areas.

First is the first character position to be highlighted, and last is the last character plus one to be highlighted. If first and last are the same, the insertion point is positioned before the character specified by first, and no characters are highlighted.

If last is greater than the number of characters in text object, then all characters between first and the end of the text are highlighted.

The following example highlights text in a field called Comments:

```
HIGHLIGHT TEXT(Comments; 9; 13)  ` Highlight the text
```

The following example positions the insertion point in a field called Comments:

```
HIGHLIGHT TEXT(Comments; 11; 11)  ` Position the insertion point
```
