

What Is ViewIt?

The ViewIt product includes two programming tools or "modules" that form a solid foundation for building sophisticated Mac programs:

ViewIt - The ViewIt module supports the creation and management of dialog and document windows that are much more powerful than those supported by the Macintosh toolbox. ViewIt eliminates the need for more expensive "dialog builders" that do less and are more difficult to use.

Facelt - The Facelt module can be optionally used to help support modeless windows, the main menu bar, floating palettes, background processing, and other program-wide features. The combination of ViewIt + Facelt eliminates the need for "program managers" and "interface builders" that often cost more and do less.

The "ViewIt On-Line Help" window includes the ViewIt and Facelt programming guides which contain further information about the use of these modules in your programs.
