

SP Close Voice (reference) -> err

reference	integer	specifys the channel you want to close. Use the reference number obtained from the SP Open Voice function.
err	integer	returns the error which occurred. A value of zero indicates no error occurred. See below for a list of possible errors.

Closes the speech channel you specify when you are finished using it.

Be sure not to call this until speech is finished otherwise it will stop. If you do this right after a SP Voice String or SP Voice Text you will hear nothing at all.

If you don't close every channel before 4D quits the external will do this for you, but you should try to close them yourself properly.

When you pass reference value -1 all currently opened speech channels will be closed and text still stored in memory will be disposed.

Example:

```
$err := SP Close Voice ($speechref)
```

```
`to close all speech channels:
```

```
$err := SP Close Voice (-1)
```

Possible errors:

- 0 No Error
- 4 Speech Pack can not be used (Speech Mgr not available)
- 111 Tried to dispose an already disposed non-relocatable block
- 231 Feature is not implemented on synthesizer
- 3000 Invalid SpeechChannel parameter, probably invalid reference number
