

## String Resources

Some string parameters can also contain a reference to a "STR#" resource in the format ":number,index", e.g. ":15000,12". By doing this the string in the resource will be used. If the resource is not found, nothing will be said and any earlier started speaking is not stopped, and an error is returned (-192). The resource can be in the structure file, 4D application or system file.
