SP Voice Type (voice; creator; id; path) -> err

voice   string (63) specifys the voice you want to use.
creator   string (4)   returns the voice creator type of the specified
                                     voice. The only   known values which may be
                                     returned are:
                                     mtk2   MacinTalk II
                                     mtk3   MacinTalk III
                                     gala   MacinTalk Pro
                                     IVox   InfoVox
id   string (4)   returns the unique voice identifier type of the
                                     specified voice. This may be a string of non-
                                     printable characters, i.e. ASCII values
                                     0,0,0 and 41.
path   string (255) returns the path to the file which contains the
                                     data for that voice.
err   integer   returns the error which occured.
                                     A value of zero indicates no error occured. See
                                     below for a list of possible errors.

Returns the voice creator and voice identifier type and the path to the file containing the data for the specified voice.

Most of the information obtained by using this function is merely for informational purposes. However when the "creator" parameter returns "gala" for a voicename, that voice can be used with the SP Voice sound function.

Examples:
  $err := SP Voice Type ("*";$creator;$id;$path)
  $err := SP Voice Type ("Marvin";$creator;$id;$path)
  $err := SP Voice Type ($voicename;$creator;$id;$path)

Possible Errors:
        0   No Error
       -4   Speech Pack can not be used (Speech Mgr not available)
     -50   Parameter error (inside external, not necessarily the
              parameters you pass)
  -108   Not enough memory
  -244   Voice resource not found
