

The enhancements which I am currently working on (ie expect to finish during 1994) are

Version 1.2

Summary in GLM window to show the values of deviance and model terms for models previously fit

Make maximum no. of levels to be specified in preferences

Predefined graphs (defined in Preferences)

In Import allowed option to use column titles if present

Paste in the data window (a budget implementation with no undo)

Version 1.3

- paste in the data window (a budget implementation with no undo)

- calculation of chisquare and F p-values (for change in deviance)

Note Although I have some ideas after these, I will probably have some more important things to do so it is unlikely that they will probably not be seen very rapidly except for a basic user manual which will be an expansion of the Help facility.
