

New

Creates a new edit window. Enter the name and details for each column. Columns may be either linear or levels (for factor variables).

Open

opens an existing file with GLMStat format

Close

Closes the edit window and saves file as required

Import

Imports data from a text file (tabs or spaces as separators)

Save

Saves file in GLMStat format

SaveAs

Saves file under a different name either in GLMStat or text format with tabs as separators.

Revert to Saved

Returns to last saved version of file

Preferences

Allows various methods to be specified. These are:

pValues

Specifies whether pValues will be calculated for results obtained. Currently this is only performed for parameter estimates but in future will be performed for Deviances.

Beep when finished

Causes the current system beep to occur when a Fit is completed.

Default Residual Method

Sets the residual method (in Define dialog) used for new files.

Page Setup

Allows specification of printer characteristics prior to printing.

Print

Print the frontmost window (either data, GLM or graph) to selected printer.

Record

Opens or closes the Record file which contains the results from the analysis. This output will be a record of all text sent to the GLM window.

Quit

Leaves program
