

YA-NewsWatcher and Binary Posting

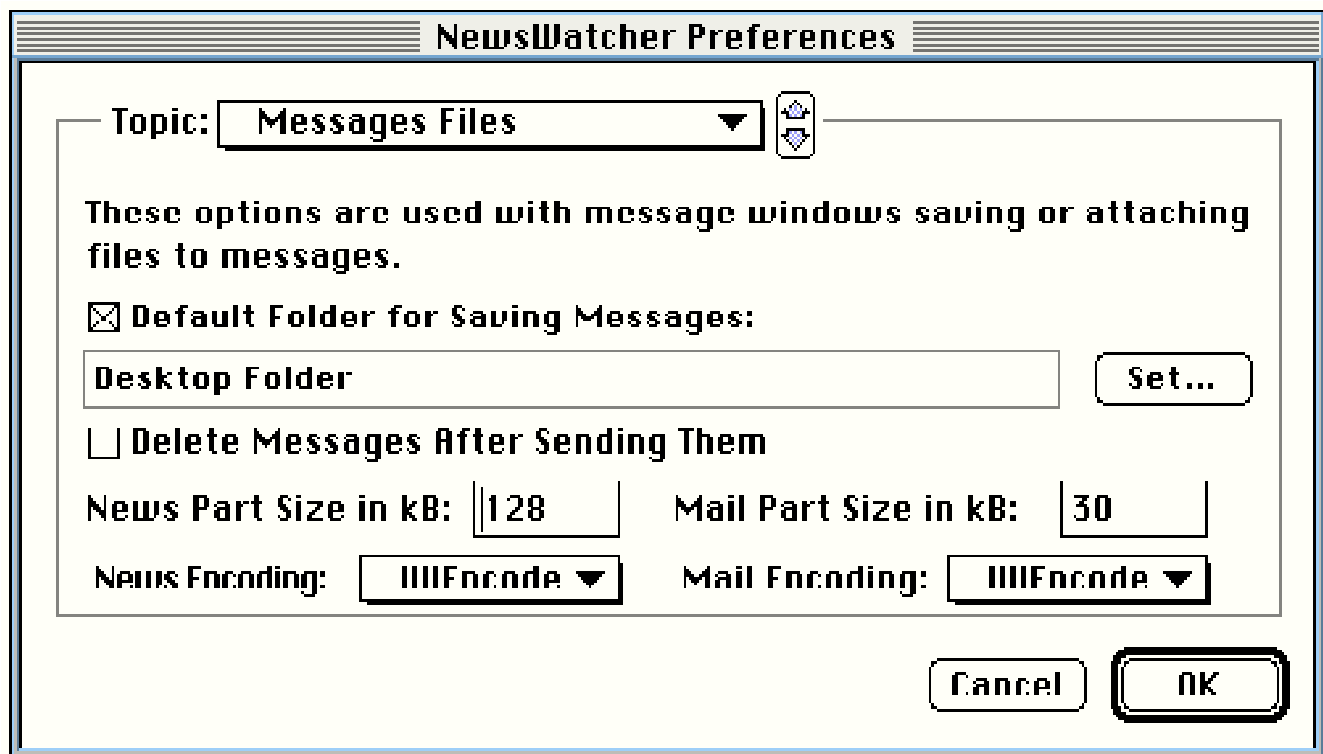

Yet Another NewsWatcher adds a new feature to NewsWatcher: transparent support for binary posting.

A file icon button is added to message windows, to the right of the "send to self" button. Clicking on it elicits a file dialog, where a single file to attach to your post may be chosen. Clicking on the Send button causes the selected file to be (optionally) uuencoded, split into several sections, and sent. The keyboard shortcut for clicking on the file icon is Command-4 (just as Command-1,2,3 are shortcuts for the other three icon buttons). If the option key is held down when clicking on Send, etc. a dialog appears allowing just a range of sections to be sent. This is useful when reposting, as only the bad sections need to be re-sent (assuming that the encoding kind and section size are not changed).

The screenshot shows a window titled "Cyberdog bites?". At the top is a toolbar with several icons: a "NEWS" icon, a document icon, a red book icon, a document with "0101 1010" text, a face with question marks, a yellow envelope, a person in a blue hat, a mail icon, and a file icon (a document with a red lightning bolt) which is currently selected by a mouse cursor. Below the toolbar is a section labeled "Send the message" containing checkboxes for "Body tabbing" and "Wrap message", a "Tab stops:" field set to "3", a "Quote string:" field set to ">", a "News encoding:" dropdown menu set to "Uuencode", and a "Mail encoding:" dropdown menu set to "Uucncode". The main body of the window contains the following text: "Newsgroups: comp.sys.mac.comm", "Subject: Cyberdog bites?", "Reply-To:", "Followup-To:", "Keywords:", "Distribution:", "Attachment:", "Extra news header lines:", "Extra mail header lines:", "Message body:", and "Signature:". On the right side of the main body is a vertical scrollbar. At the bottom right corner of the window are three small icons: a downward arrow, an upward arrow, and a document icon.

Related to this, there are four new preference items, under "Message Files" (which was formerly named "Saving Messages" in John Norstad's version). "News part size in kB" lets you set the approximate size in kB of each section of the file being posted. "Mail part size in kB" does the same for files being emailed. Values of about 32 to 64 are reasonable. The actual number of bytes in the section will be somewhat greater, since this number does not include the header lines or any of the additional lines required to mark the start and end of segments, the encoding method, etc. Please also note that temporary system memory is used when posting files. The amount of memory required is somewhat greater than the value entered in the two "part size in kB" boxes. Using temporary memory means that you do not have to increase the memory partition of Yet Another NewsWatcher in order to send large files. In fact, since increasing the memory partition reduces the amount of memory available to the system and other applications, it reduces the amount of temporary memory available for sending attached files.

The screenshot shows the 'NewsWatcher Preferences' dialog box. The 'Topic:' dropdown menu is set to 'Messages Files'. Below this, a text box explains that the options are used with message windows for saving or attaching files. There are four main settings: 1) 'Default Folder for Saving Messages' is checked, with a text box showing 'Desktop Folder' and a 'Set...' button. 2) 'Delete Messages After Sending Them' is unchecked. 3) 'News Part Size in kB' is set to '128' in a text box. 4) 'Mail Part Size in kB' is set to '30' in a text box. At the bottom, there are two dropdown menus for 'News Encoding' and 'Mail Encoding', both currently set to 'UUENCODE'. 'Cancel' and 'OK' buttons are at the bottom right.

Setting	Value
Topic	Messages Files
Default Folder for Saving Messages	Desktop Folder
Delete Messages After Sending Them	Unchecked
News Part Size in kB	128
Mail Part Size in kB	30
News Encoding	UUENCODE
Mail Encoding	UUENCODE

The two other popup menus, labeled "News encoding:" and "Mail encoding:" permit you to specify how the attached file will be encoded before posting. These popup menus also appear in the options panel in message windows (visible when "Show Details" is enabled), allowing the default value to be overridden for a particular post. The available options are uuencoding (the standard internet encoding method), binhexing (appropriate for Macintosh files) and none (for plain text files).

Cyberdog bites?

Generally uuencoding should be used for binary posts to non-Macintosh binary newsgroups, and for binary email to non-Macintosh users. BinHex encoding may be used to email a Mac file to another Mac-using friend, or to post a Mac file to a Mac-only binary newsgroup. No encoding should be used to post or email long pure-text files.

Note that the wrap checkbox in the control panel affects how unencoded binary posts are handled. If it's checked, then the file's text will be wrapped to 80 columns. If it's not, the file's text will still be wrapped to 1000 columns (which was chosen because that's the guaranteed lower limit for maximum line lengths for mail servers).

The name of the file, and the part number, will be prepended to whatever subject line you entered in the message window. For example:

Subject: My test post

would become when sent:

Subject: -Jupiter.gif [0/1] My test post

etc. if you were posting a file named Jupiter.gif. The text entered in the body of the message window becomes the descriptive information supplied in part 0 of the binary post. If you are posting a file to usenet, you must enter at least a single sentence description of the file being posted. If you attempt to skip this act of consideration to others, an alert is displayed asking that you enter a description in the part 0 message body. If you are only emailing an attached file you may omit the part 0 description. If the part 0 description is empty it is not sent. You always need to supply a part 0 description for binary posts.
