

Decode da Code

A MIME/base64 and UUEncoded(.uu) file decoder

Version 1.0.3

© Lucius Kwok January 24, 1999

Decode da Code is a shareware (\$12) application which decodes base64 and uuencode(.uu) encoded files, and can figure out multi-part MIME mail messages, including files encoded in the AppleDouble format. It can use Internet Config to set the appropriate file type and creator codes, and to post-process the decoded file.

Decode da Code was designed as a helper application for Internet programs such as NewsWatcher, to decode encoded binary files. In the preferences, you can set Decode da Code to automatically delete files after they have been decoded, to keep your disk tidy.
