

Tone Decode

This mode decodes several types of tones which are commonly heard on the VHF/UHF bands.

These buttons select which type of tone to decode:

DTMF (“Touch Tone” which is probably a trademark of the telephone company)

EIA

CCIR

XPH tones

The decoded digits are displayed in the text window.

(XPH is a spy numbers station that sends messages via tones, rather than voice or morse code. It is believed to be operated by a Russian intelligence organization)
