

When SchemeChecker is done checking schemes, it displays a result window. A list of the schemes that were checked is displayed at the left of the window. Clicking on a scheme in this list will bring up that scheme's results.

The results are displayed on the right side of the window. If a scheme has no known errors, SchemeChecker will display a message, telling this. Otherwise, the number of errors will be shown.

- [Save report...](#): This button will write the results to a text file which you can open in your favorite text editor.

- [The "View" buttons](#): Depending on what errors SchemeChecker finds in a scheme, one to three "View" buttons will be shown. Clicking one of these buttons will show exactly in which resources SchemeChecker discovered errors. These buttons are explained in the next three sections of this help text.

- [Further info on this scheme](#): When the result window opens, or when you select a different scheme from the list, this button will be automatically selected. The field below this button may display:

- The scheme's version number and the minimum Kaleidoscope version it supports
- If the scheme has a custom WDEF (and the version number, if the BeBox WDEF is used)
- Whether the scheme has an info dialog or not.
- If the scheme has a Finder double-click string
- If the scheme was made by the authors of Kaleidoscope.
- Other important information about the scheme.
