

SchemeChecker also checks to make sure all required resources are included in the schemes. The current version of SchemeChecker uses the resource list from Kaleidoscope 1.8.2. In addition, it also support the resource set found in schemes using the BeBox WDEF.

For schemes that have been configured to only run with **Kaleidoscope 2.0** or later, SchemeChecker will not check for missing resources. If a resource is missing in such a scheme, Kaleidoscope will use the standard MacOS Platinum resources, and it will not cause any problems.

Schemes using a custom WDEF (other than the BeBox WDEF) have their own set of resources, which may be slightly different from the list SchemeChecker uses. If a scheme has a custom window definition (WDEF), this will be displayed in the "further info" field.

SchemeChecker does not provide you with a way to deal with missing resources. If SchemeChecker reports a large number of missing resources in a scheme, and this scheme is not made by you, you should send the report to the author by e-mail and ask him/her to release an update to this scheme rather than trying to solve the problems on your own. Remember to tell the author about SchemeChecker and include the URL from where SchemeChecker can be downloaded.

Click the "View" button to display the list of missing resources. Select a resource in the list to get more information on what the resource is used for.
