Chimoo Timer 1.0 for MacOS X

Chimoo Timer is a very rudimentary timer originally written to keep track of time when working at home (although it can also be used for other purposes). It doesn't have too many features, but hopefully it will be useful to some of you. Feel free to send us some email with any suggestions or comments about the program.

Chimoo Timer is Freeware - please use it and distribute it (as long as you include this original readme file and don't sell it!) as you wish. Send us email if you like it!

Instructions:

Basic operation is pretty simple. It starts in countdown mode by default. Choose a time from the popup menus and press "Start." To count up instead, move the slider on the left to the up position. Note, the time selection menus will be disabled in counting-up mode. The menus also remain disabled as a rule until you've reset the timer.

If you would like more options for the time increments (more choices for hours and minutes, in addition to a seconds menu), click on the little triangle at the bottom right hand corner. Note, these settings will remain in effect even if revert it to the smaller size.

Note, if the timer display appears jumpy, this is only because you have it set to a low refresh rate, but the times shown will still be accurate. In order to have it refresh more often, choose "Hog Processor" from the popup menu on the right hand side of the window (when it's folded out).

Version Change History:

1.0 27 January, 2002
First released version.
