## Print Dialogs: Adding Items

### Imaging

Revised by:

March 1988

Written by: Ginger Jernigan  
Lew Rollins

November 1986

This technical note discusses how to add your own items to the Printing Manager's dialogs.

---

When the Printing Manager was initially designed, great care was taken to make the interface to the printer drivers as generic as possible in order to allow applications to print without being device-specific. There are times, however, when this type of non-specific interface interferes with the flexibility of an application. An application may require additional information before printing which is not part of the general Printing Manager interface. This technical note describes a method that an application can use to add its own items to the existing style and job dialogs.

Before continuing, you need to be aware of some guidelines that will increase your chances of being compatible with the printing architecture in the future:

- Only add items to the dialogs as described in this technical note. Any other methods will decrease your chances of survival in the future.
- Do not change the position of any item in the current dialogs. This means don't delete items from the existing item list or add items in the middle. Add items **only at the end** of the list.
- Don't count on an item retaining its current position in the list. If you depend on the Draft button being a particular number in the ImageWriter's style dialog item list, and we change the Draft button's item number for some reason, your program may no longer function correctly.
- Don't use more than half the screen height for your items. Apple reserves the right to expand the items in the standard print dialogs to fill the top half of the screen.
- If you are adding lots of items to the dialogs (which may confuse users), you should consider having your own separate dialog in addition to the existing Printing Manager dialogs.

## The Heart

Before we talk about how the dialogs work, you need to know this: at the heart of the printer dialogs is a little-known data structure partially documented in the MacPrint interface file. It's a record called `TPrDlg` and it looks like this:

```
TPrDlg = RECORD    {Print Dialog: The Dialog Stream object.}
    dlg            : DialogRecord;    {dialog window}
    pFltrProc      : ProcPtr;         {filter proc.}
    pItemProc      : ProcPtr;         {item evaluating proc.}
    hPrintUsr      : THPrint;         {user's print record.}
    fDoIt          : BOOLEAN;
    fDone          : BOOLEAN;
    lUser1         : LONGINT;         {four longs reserved by Apple}
    lUser2         : LONGINT;
    lUser3         : LONGINT;
    lUser4         : LONGINT;
    iNumFst        : INTEGER;         {numeric edit items for std filter}
    iNumLst        : INTEGER;
    {... plus more stuff needed by the particular printing dialog.}
END;
TPPrDlg = ^TPrDlg;           {== a dialog ptr}
```

All of the information pertaining to a print dialog is kept in the `TPrDlg` record. This record will be referred to frequently in the discussion below.

## How the Dialogs Work

When your application calls `PrStlDialog` and `PrJobDialog`, the printer driver actually calls a routine called `PrDlgMain`. This function is declared as follows:

```
FUNCTION PrDlgMain (hPrint: THPrint; pDlgInit: ProcPtr): BOOLEAN;
```

`PrDlgMain` first calls the `pDlgInit` routine to set up the appropriate dialog (in `Dlg`), dialog hook (`pItemProc`) and dialog event filter (`pFilterProc`) in the `TPrDlg` record (shown above). For the job dialog, the address of `PrJobInit` is passed to `PrDlgMain`. For the style dialog, the address of `PrStlInit` is passed. These routines are declared as follows:

```
FUNCTION PrJobInit (hPrint: THPrint): TPPrDlg;
FUNCTION PrStlInit (hPrint: THPrint): TPPrDlg;
```

After the initialization routine sets up the `TPrDlg` record, `PrDlgMain` calls `ShowWindow` (the window is initially invisible), then it calls `ModalDialog`, using the dialog event filter pointed to by the `pFltrProc` field. When an item is hit, the routine pointed to by the `pItemProc` field is called and the items are handled appropriately. When the OK button is hit (this includes pressing Return or Enter) the print record is validated. The print record is not validated if the Cancel button is hit.

## How to Add Your Own Items

To modify the print dialogs, you need to change the `TPrDlg` record before the dialog is drawn on the screen. You can add your own items to the item list, replace the addresses of the standard dialog hook and event filter with the addresses of your own routines and then let the dialog code continue on its merry way.

`TPrDlg` record for you and return a pointer to that record. Then call `PrDlgMain` directly, passing in the address of your own initialization function. The example code's initialization function adds items to the dialog item list, saves the address of the standard dialog hook (in our global variable `prPItemProc`) and puts the address of our dialog hook into the `pItemProc` field of the `TPrDlg` record. Please note that your dialog hook **must** call the standard dialog hook to handle all of the standard dialog's items.

**Note:** If you wish to have an event filter, handle it the same way that you do a dialog hook.

Now, here is an example (written in MPW Pascal) that modifies the job dialog. The same code works for the style dialog if you globally replace 'Job' with 'Stl'. Also included is a function (`AppendDITL`) provided by Lew Rollins (originally written in C, translated for this technical note to MPW Pascal) which demonstrates a method of adding items to the item list, placing them in an appropriate place, and expanding the dialog window's rectangle.

## The MPW Pascal Example Program

```
PROGRAM ModifyDialogs;

  USES
    {$LOAD PasDump.dump}
    MemTypes, QuickDraw, OSIntf, ToolIntf, PackIntf, MacPrint;

  CONST
    MyDITL      = 256;
    MyDFirstBox = 1;           {Item number of first box in DITL}
    MyDSecondBox = 2;

  VAR
    PrtJobDialog: TPrDlg;      { pointer to job dialog }
    hPrintRec    : THPrint;    { Handle to print record }
    FirstBoxValue,
    SecondBoxValue: Integer;   { value of first additional box }
                                { value of second addtl. box }
    prFirstItem,
    prPItemProc : LongInt;     { save our first item here }
                                { need to store old itemProc here }
    itemType    : Integer;     { need for GetDItem/SetDItem calls }
    itemH        : Handle;
    itemBox      : Rect;
    err          : OSErr;

  {-----}

  PROCEDURE _DataInit;
    EXTERNAL;

  {-----}
```

```
PROCEDURE CallItemHandler(theDialog: DialogPtr; theItem: Integer;
                          theProc: LongInt);
    INLINE $205F          { MOVE.L (A7)+,A0 }
    , $4E90;              { JSR (A0)  }

{ this code pops off theProc and then does a JSR to it, which puts the
real return address on the stack. }

{-----}

FUNCTION AppendDITL(theDialog: DialogPtr; theDITLID: Integer): Integer;
{ version 0.1 9/11/86 Lew Rollins of Human-Systems Interface Group }
{ this routine still needs some error checking }

{ This routine appends all of the items of a specified DITL
onto the end of a specified DLOG - We don't even need to know the format
of the DLOG }

{-----}

FUNCTION MyJobDlgInit(hPrint: THPrint): TPrDlg;
{
This routine appends items to the standard job dialog and sets up the
user fields of the printing dialog record TPrDlg
This routine will be called by PrDlgMain
```

This is what it does:

1. First call PrJobInit to fill in the TPrDlg record.
  2. Append our items onto the old DITL. Set them up appropriately.
  3. Save the address of the old item handler and replace it with ours.
  4. Return the Fixed dialog to PrDlgMain.
- }

```
VAR
    firstItem      : Integer; { first new item number }

BEGIN
    {MyJobDlgInit}
    firstItem := AppendDITL(DialogPtr(PrtJobDialog),MyDITL);

    prFirstItem := firstItem; { save this so MyJobItems can
                                find it }

    { now we'll set up our DITL items - The "First Box" }
    GetDItem(DialogPtr(PrtJobDialog),firstItem,itemType,itemH,itemBox);
    SetCtlValue(ControlHandle(itemH),FirstBoxValue);

    { now we'll set up the second of our DITL items - The "Second
Box" }
    GetDItem(DialogPtr(PrtJobDialog),firstItem +
1,itemType,itemH,itemBox);
    SetCtlValue(ControlHandle(itemH),SecondBoxValue);

{ Now comes the part where we patch in our item handler. We have to save
the old item handler address, so we can call it if one of the standard
items is hit, and put our item handler's address
in pItemProc field of the TPrDlg struct}

    prPItemProc := LongInt(PrtJobDialog^.pItemProc);
