Read the FTPd Documentation file, especially the Security Considerations section. Then in FTPd Setup, choose Privileges, Preferences, Security, and User Directories in turn and fill out their respective windows.   Then set your File Sharing privileges as you want them, edit the Startup messages and the !Folder Info file (moving copies of !Folder Info into various folders).   And finally, put an alias to FTPd in the Startup folder and start it up.

Requires: System 7, File Sharing enabled, and MacTCP 1.1.   Balloon Help is available for the various configuration windows.

Thanks go to Rhys for his help with the TCP code, and you can make him very happy by downloading his amazing "GameMaster" program!   Also, many thanks go to Quinn and Jager for their many hours of debugging, and to Stuart who was responsible for massive delays in this program by making LOTS of suggestions and by writing Bolo!
