This is a demo version of the complete Note Speller. The Note Speller is part of the on going Music Lab Series which uses computer resources to accelerate traditional musical training and development. The complete Note Speller covers both the Treble and Bass clef as well as chromatic and diatonic notes.

Students will be asked to play notes on the computer simulated piano. This piano actually works! Students may choose between several sounds. Piano, organ, harpsichord, flute, orchestra, trumpet and sax. You may play the piano with the mouse, computer keypad or optional midi keyboard. Your progress will be monitored on a computerized scoreboard. Students may win a printable certificate. There are also special sound and visual effects to entertain you along the way.

The Music Lab's piano and staff are large enough for any one to read. Children will be able to operate the program without struggling. Students will have complete control over the note range and clef they are working in. They may also separate the white and black notes. This means the music students will be able to use the program from day one. They will not have to wait until they reach a certain level before benefiting. There is also an extensive balloon help system which gives you tips and pointers about music. Its like having a teacher always at your side. Students will learn the notes by simply just leaving the balloons on.

In my opinion, this is one of the best music education program anywhere. It will accomplish what it sets out to do. Children will learn to play music very quickly and will have fun doing it. The full program is available to you for only \$25.00. Even though this is only a demo version, it is still very functional.

The following features have been disabled

- 1- Some sounds have been removed
- 2- You may not use a midi keyboard
- 3- You will not have access to the bass clef exercises

•Special note, This is a color demo only, it will not work on black and white machines. I have made a special B.W version that only requires 800k of ram. If you are interested in this, please contact me about a demo disk.
