

A/S supports two program modes to help reduce program complexity for less experienced users.

The Configure mode provides access to all controls used to adjust how A/S processes files. This mode can be confusing for some users as there are quite a few controls.

The Process Only mode hides most controls used to adjust how A/S processes files. This simpler mode may be preferred if a user tends to use the default settings or only a few settings files. These settings files may be placed in a folder that A/S will scan, placing the file names in a hierarchical settings menu. Choosing one of these menu items opens that settings file without having to use the file picker.

The current mode is remembered.
