

Troubleshooting 1

The volume to be cataloged **MUST** be an HFS volume. If you're using system 6.0.5 or later (including System 7.x.x), you can be certain that your volumes are HFS volumes. Some Bernoulli drives and Opticals are **NOT** HFS-compatible.

The Catalog Menu is "built" only once, during initialization when Catalog 3.0 first starts up. So be sure the volume you want to catalog is mounted **BEFORE** you double click on Catalog 3.0. Also, **DON'T** try to catalog a volume that you have un-mounted, even though its name may still appear in the Catalog Menu.
