

Printing and Page Setup.

Graphplot supports printing in the standard manner. before printing, choose '**Page Setup**' and configure the printer as you require.

To print the current graph, choose '**Print**'. You will be prompted for the number of copies, etc, in the normal Macintosh way. Graphplot prints graphs at the same size they appear on screen, but at the printer's resolution. The graph will be centred horizontally on the page, a little way down from the top. If the graph is larger than the width of the page, the image will be clipped: Graphplot does not tile the image over several pages.

If you have a colour printer, Graphplot will print graphs in colour.
