

Editing the header

Use the 'Edit header' item on the Special menu to show the edit header dialog box.

This shows the header information contained in the dictionary. You will rarely need to alter these default settings.

They are as follows:

[Atom type](#)

This is always 'dict' for a pronunciation dictionary.

[Format version](#)

Always '1', apparently, for pronunciation dictionaries.

[Script system](#)

The script system under which the dictionary is intended to be used. For Roman script systems, this should be 0.

[Language code](#)

The language code under which the dictionary is intended to be used. For English language systems, this should be 0.

[Region code](#)

Ditto, for the region. For the US, this is 0.

[Last modified date](#)

No guesses what this is.

You will also see the 'Total byte length' of the dictionary, which is a measure of how much memory it takes when loaded.

You can also use Balloon Help to get more information on the various items.
