

ClockSync 0.9.0a

by
Jeremy Kezer

What is it?

If you have two or more Macintoshes, you probably notice that the clocks drift apart as time goes by. This can range from being a minor nuisance to a real pain, especially if you tend to do a lot of file synchronizing between the Macintoshes. [ClockSync](#) synchronizes the clocks between two Macintoshes, by setting the clock of "servant" Macintoshes to be the same as the clock of a "master" Macintosh. While it's a big help if you have just two or three Macintoshes, it can be real life-saver on big networks!

This is probably the simplest utility to operate. Place a copy of ClockSync on your "master" file server, and run it from your "servant". ClockSync will automatically sync 'em up!

ClockSync is shareware!

ClockSync is a shareware product. If you find it useful, please consider paying the shareware fee. Not only will you help to support my efforts, but by becoming a registered user, I will notify you by email of future versions. Please see the "[Registration form](#)" chapter in this document for more information.

Also, feel free to share this program with your friends!

Pre-release release

Because this is a pre-release version, it may not work as advertised on all systems or networks. Please report any bugs to me at jbkezer@aol.com.
