

## Settings Menu

The Settings menu allows you to change the way MacPing operates. All settings except Pause will be preserved when you quit MacPing.

### Beep When Drops Occur

To make it easier to notice that a packet has been dropped, choose Beep When Drops Occur. MacPing will beep the first time a device fails to reply to a probe packet. Clicking on the speaker icon in the window will also toggle the beep setting.

### Ignore Non-Responders

Devices that have been turned off or that don't respond make testing slower. Choose Ignore Non-Responders to cease probing devices after they fail to respond five times in a row. Choose Ignore Non-Responders again to select all devices again. Devices that are currently being ignored have a "◊" appended to the name and have no trace on the screen.

### Self Send

A Macintosh computer will send packets to itself if the Self Send command is set. This is useful to see which AppleTalk NBP names are registered on the Macintosh running MacPing.

### Number Format

MacPing can display numbers in three number bases: Octal, Decimal, or Hexadecimal. Choose one of the three to display these numbers in your preferred number base. The default choice is Decimal.

Note: Time values, the Percent Dropped figures , and IP addresses are always displayed in decimal.
