

## Find/Find again

The Find command allows you to search the entire device list for names and types that contain a desired string. MacPing always performs a case-insensitive string match. Names that match the string are selected and made visible in the device list.

- The Find All checkbox in the Find dialog will select all devices that match the search string. It is then convenient to use View by Selected (described below) to move these devices to the top of the device list.
- The Add To Selection checkbox in the Find dialog causes newly found devices to be added to previously selected devices.

The Find Again command selects the next device that contains a name or type that matches the Find string.
