

TKpathname

XFCN

No. 4407

Version: 5.0 (public domain)

Copyright © 1990 - 1994 by Stan Gilbert

TKpathname returns variations of a full pathname. It can return the full pathname, leafname (just the filename), volume name, or the full pathname of an "added" filename. This is a very powerful XFCN and its use is not always obvious. For instance, it can be used to add a stack to the "stacksinuse" hierarchy.

ð

Examples

```
ÓÊget TKpathName("add","Drawings:MacPaint:")
ÊÊ>get TKpathName("leaf",fileName)
ÊÊ>get TKpathName("vol")
ÊÊ>get TKpathName("full")
```

Parameters

Parameter 1

These commands are mutually exclusive

add: Append addName (parameter 2) to the pathname of the current stack

leaf: Return only last name (leaf or filename) of full pathname

vol: Return only volume name of current stack

full: Return entire pathname, excluding stackname

home: Return full path and stackname of Home stack

Parameter 2

name: Namefile for use only with "add" or "leaf".

Return Values

get TKpathname(short name of this stack)

Returns the full pathname of the current stack. A pathname does NOT include the name of the stack itself.
